Introduction: Arterial stiffness is known to be associated with atherosclerosis, cardiac remodelling and cardiovascular diseases. In recent studies, common carotid artery rigidity was seen to better predict cardiac morphology and function if compared to aortic parameters. The aim of the study was to determine the relation between carotid/aortic stiffness indices and the main echocardiographic measures in patients with rheumatologic disease.

Methods: 208 participants were evaluated (57.4 ± 11.4 yr; males = 36.1%); 65.9% were previously diagnosed with rheumatoid arthritis, 20.2% with psoriatic arthritis and 13.9% with ankylosing spondylitis. In each subjects medical history, use of drugs and glico-metabolic status was assessed. Echocardiography, blood pressure (BP) measurement and carotid ultrasonography were performed. Carotid Distensibility (CD) and Aortic Stiffness (AoS) were measured as indices of arterial stiffness.

Results: Mean Left Ventricular Mass indexed by body surface area (LVM/BSA) was not associated with any anthropometric, anamnestic and vascular parameters. DC was correlated with age (r = 0.325, p < 0.0001) and mean BP (r = 0.502, p < 0.0001) while AoS was correlated with age and the proportion of systolic blood pressure (r = 0.191, p = 0.007).

Conclusion: Results are consistent with a possible predictive role of DC assessment in left cardiac hypertrophy and remodelling and a direct link between AoS and left ventricular diastolic function.

Photoplethysmography (PPG) is a biophotonic technique which measures blood volume variations in vascular bed and it is well known for its utilization in pulse oximetry for the estimation of arterial blood oxygen saturation. Moving particles within the tissue bed generate rapidly changing absorption caused by the heart beats, while stationary components will cause a relatively constant absorption. The detected light in PPG is therefore caused by the heart beats, while stationary components will cause a rhythmic fluctuation caused, e.g., respiratory activity. The test results according to the empirical equations.

CARDIOVASCULAR RISK EVALUATION IN BEHÇET’S PATIENTS—THE ROLE OF CHRONIC INFLAMMATION IN ARTERIAL STIFFNESS
Maria Guimarães, Glória Alves, Cristina Cunha, Marta Cunha
Hospital Senhora da Oliveira, Guimarães, Portugal

Introduction: Behçet’s disease (BD) is a chronic inflammatory syndrome with systemic manifestations. Systemic vasculitis contribute to vascular aging, increasing the arterial stiffness that can be inferred from the Pulse Wave Velocity (PWV) measurement. Carotid ultrasound evaluation allows vascular wall changes detection, as the increase of intima-media thickness (>40% of IMT) and plaques. These alterations increase cardiovascular risk (CVR).

Methods: 49 patients were included. Anthropometric, sociodemographic, laboratorial, comorbidities, medication, peripheral and central blood pressure, Systematic Coronary Risk Evaluation, PWV and carotid ultrasound abnormalities data were evaluated. To understand the role of chronic inflammation in arterial stiffness, comparative analyzes were performed with a control group with CVR factors and with a group of healthy individuals.

Results: The sample consisted mainly of women (61.2%), characterized by 30.6% of arterial hypertension, 32.7% of dyslipidemia, 4.1% of diabetes and 14.3% of obesity. PWV median value was 8.32m/s, with 30.6% PWV > 90th percentile of the normal reference population and 16.3% with target organ lesion. >40% of IMT in the common carotid artery (CCA) and plaques were observed in 10.4% and 41.7%, respectively. In the obtained linear regression model, the variables systolic blood pressure and ‘IMT in the ACC showed a statistically significant impact on PWV. In the established comparisons, PWV did not present statistically significant differences. Conclusion: The integrated analysis of the collected data made it possible to requalify the patients in the context of the CVR, allowing the early adoption of control measures. Chronic inflammation associated with BD did not lead to significant differences in arterial stiffness.
