Published online: 7 December 2019
Conclusions:
Counterpulsation were also exactly defined noninvasively. On Arteriograph-registrations. Furthermore, the onset and the end of the diastolic counterpulsation pressure waves could be correctly identified in Arteriograph24 when Arteriograph24 is validated against invasive SBPao measurement by invasive values. Our results confirm that the SBPao values, measured by invasive IABP and noninvasive ones by Arteriograph of SBPao was never published yet.

Aim: The aim of this work was to compare the SBPao values measured with these two modalities.

Subjects and method: 11 severely ill patients placed on IABP were included into this study. Noninvasive monitoring of SBPao was carried out by Arteriograph24 simultaneously with IABP. Descriptive statistics were calculated for both measurements and the variables were indicated as means and standard deviations. Linear regression analysis was carried out to define the relationship between the invasive and noninvasive variables.

Results: A strong and linear relation was found between the invasive and non-invasive SBPao values, Pearson's correlation coefficient was \( r = 0.76; p < 0.001 \). The diastolic counterpulsation pressure waves could be correctly identified on Arteriograph-registrations. Furthermore, the onset and the end of counterpulsation were also exactly defined noninvasively.

Conclusions: The noninvasive SBPao values showed strong correlation with invasive values. Our results confirm that the SBPao values, measured by Arteriograph24, are close to the true aortic SBP. This is the first investigation when Arteriograph24 is validated against invasive SBPao measurement by IABP.

Intraaortic balloon counterpulsation (IABP) is a method of temporary mechanical circulatory support in patients suffering from cardionic shock to improve the balance of myocardial oxygen supply and demand by using systolic unloading and diastolic augmentation. Arteriograph is an invasively validated oscillometric device which measures central blood pressure (SBPao) noninvasively.

The recently developed Arteriograph24 is a combination of a 24-hour BP-monitor and a single-measurement Arteriograph which provides both 24-hour peripheral and central BP profiles. Comparison of simultaneous invasive measurements by IABP and noninvasive ones by Arteriograph of SBPao was never published yet.

**Subjects and Method:** To investigate the possible relation between aortic stiffness, frailty and frailty in older patients undergoing Transcatheter Aortic Valve Implantation (TAVI).

**Methods:** TAVI Care&Care is an observational ongoing study including consecutive patients undergoing TAVI procedure at the Erasmus University Medical Center. Prior to TAVI echocardiography was performed and aortic stiffness was measured non-invasively by the Mobil-O-Graph. The frailty status was assessed including 5 domains. Primary outcome was to investigate the relationship between the frailty status and functional cardiovascular parameters and frailty status. Linear regression was used.

**Results:** A total of 212 patients were included for analysis. Mean age was 79.2 years (±7.8), 52.7% men, mean Aortic Valve Area (AVA) was 0.73 (± 0.3), mean Pulse Wave Velocity was 12.6 (± 1.5). Frailty was found in 57.8%. Peripheral pressure (p = 0.04) and central pulse pressure (p = 0.02) but not aortic stiffness were associated with AS severity. AVA was associated with frailty (p = 0.02) whereas measures of aortic stiffness were not.

**Conclusion:** Aortic valve area but not measures of aortic stiffness is associated with frailty status in elderly patients with AS undergoing a TAVI procedure.

**Objective:** Sodium-glucose co-transporter-2 inhibitors reduce blood pressure and renal and cardiovascular events in patients with type 2 diabetes through not fully elucidated mechanisms. Aim of this study was to investigate whether dapagliflozin is able to acutely modify systemic and renal vascular function.

**Methods:** Neuro-hormonal and vascular variables, together with 24-hour urinary sodium, glucose, isotopones, diuresis and free-water clearance, were assessed before and after a 2-day treatment with dapagliflozin 10 mg/die in 16 type 2 diabetic patients. Brachial artery endothelium-dependent and independent vasodilation (by flow-mediated dilation) and pulse wave velocity were assessed. Renal resistive index was obtained at rest and after glycerol trinitrate administration.

**Results:** Dapagliflozin decreased systolic blood pressure and urinary isotopones and induced an increase in 24-hour diuresis, 24-hour urinary glucose and serum magnesium; 24-hour Na and fasting blood glucose were unchanged; serum magnesium slightly increased. Flow-mediated dilation was significantly increased (2.8 ± 2.2 to 4.0 ± 2.1%, p < 0.05), and pulse-wave-velocity was reduced (10.1 ± 1.6 to 8.9 ± 1.6 m/s, p < 0.05), even after correction for mean blood pressure. Renal resistive index was reduced (0.62 ± 0.04 to 0.59 ± 0.05, p < 0.05), as well as its response to nitrates. Conclusions: An acute treatment with Dapagliflozin significantly improves systemic endothelial function, arterial stiffness and renal resistive index; this effect is independent of changes in blood pressure and occurs in the presence of stable natriuresis, suggesting a fast, direct beneficial effect on the vasculature, possibly mediated by oxidative stress reduction.

EFFECT OF CHRONIC INFLAMMATION INHIBITION WITH SALSALATE ON AORTIC STIFFNESS AND VASCULAR ENDOTHELIAL FUNCTION IN OLDER ADULTS: A RANDOMIZED CONTROLLED STUDY

Chronic activation of the proinflammatory transcription factor nuclear factor kappa-B (NFkB) is linked to age-associated vascular dysfunction. Acute inhibition of NFkB with high-dose salsalate (4g), a non-acetylated salicylate known to block NFkB activation, improves aortic stiffness and endothelial function in aged rodents and humans.

Therefore, we hypothesized that chronic salsalate therapy at the US FDA approved starting dose (3g/day) would improve age-associated aortic stiffness and endothelial dysfunction in older adults. A total of 28 normotensive older adults (57.4 ± 1.3 years; 11M/17F) were randomized to salalate 3g/day (n = 14) or placebo (n = 14) for 4 weeks and had assessments of aortic stiffness (carotid-femoral pulse wave velocity, CFPWV) and endothelial function (brachial artery flow-mediated dilation, FMD).

A group of 17 young adults (age 26 ± 1 years) were not randomized. As expected, baseline CFPWV was higher (8.1 ± 0.3 vs 5.3 ± 0.2 m/sec, p < 0.01) and FMD was lower (3.4 ± 0.8 vs. 5.9 ± 1.05, p = 0.03) in the older vs.
young. In the older adults, neither FMD (SALS: 3.5 ± 1.4 to 4.6 ± 1.2%; PLAC: 3.4 ± 1.2 to 2.5 ± 1.3%, ANOVA P = 0.98) nor CFPWV (SALS: 8.1 ± 0.5 to 8.4 ± 0.6 m/sec; PLAC: 7.6 ± 0.5 to 7.6 ± 0.4 m/sec, ANOVA P = 0.41) was altered after 4 weeks of salsalate vs. placebo. These data fail to demonstrate that chronic salsalate treamproves age-associated aortic stiffness or endothelial dysfunction in older adults. Future studies should test longer duration therapy or more selective inflammatory inhibitors on vascular aging in humans.

Purpose/Background/Objectives: We investigated the acute effect of electronic cigarette (EC) smoking on the aortic pressure waveform amplification. We also sought to compare the effect of EC and combustible cigarette (TC) smoking on central haemodynamics.

Methods: We studied 24 smokers (age: 30 ± 8 years) on 3 separate occasions: a) tobacco cigarette (nicotine content, 1.2 mg) over 5 minutes, b) EC (18 mg E-liquid) for a period of 30 minutes, and c) nothing (sham procedure) for 60 minutes. Smoking EC for 30 min (15 puffs) was chosen to mimic the common pattern of EC smoking.

Results: Both TC and EC smoking caused a significant increase in brachial pressures and heart rate (HR), and the differences in blood pressure (BP) and HR responses between the two smoking forms were not significant. The aortic pressures also increased significantly after smoking both TC and EC, with the greatest changes seen in the first 5 minutes after TC smoking and 15 minutes EC smoking (figures 1A–C, all P < 0.05). Although Alx, decreased in both two smoking forms, by applying a correction factor for changes in HR, the Alx increased significantly after TC (by 3.0% at 5 minutes, P < 0.05) and EC (by 2.9% at 15 minutes, P < 0.05) (figure 1D).

Conclusions: Electronic cigarette smoking exerts an unfavourable and comparable to that of TC smoking acute effect on aortic pressure waveform amplification. Given the prognostic role of central haemodynamics on cardiovascular disease risk, EC may still be considered a hazardous smoking method.

THE EFFECT OF L-ARGININE ON THE VASCULAR FUNCTION IN HEALTHY TRAINED AND SEDENTARY SUBJECTS

Ksenija Cankar, Tina Virtic, Polona Zaletel, Ziva Melik
University of Ljubljana, Faculty of Medicine, Institute of Physiology, Slovenia

Background: The aim of our study was to determine whether the use of food supplement L-arginine improves vascular function, which could be beneficial in preventing the formation and development of cardiovascular diseases. We investigated differences between trained and sedentary subjects.

Method: Measurements were performed in healthy normotensive men, divided into four groups, according to age and physical activity: 12 young sedentary (YS) (mean age 23.5 ± 6 years) and 11 elder sedentary (ES) (mean age 45.7 ± 6.3 years) subjects. PWVcf was measured by Complior device.

Results: After ingestion of L-arginine the heart rate in all groups statistically significantly decreased (YS 70.4 ± 4.2 vs. 66.3 ± 3.3; YT 62.1 ± 2.7 vs. 58.3 ± 2.0; ES 69.6 ± 3.2 vs. 62.7 ± 2.7; ET 58.0 ± 1.8 vs. 53.6 ± 1.2 beats/min) (paired t-test, p < 0.05). The cardiac output decreased in three groups (YT 7.04 ± 0.4 vs. 6.32 ± 0.3; ET 6.95 ± 0.5 vs. 5.9 ± 0.4; UT 7.08 ± 0.6 vs. 6.58 ± 0.4 L/min) (paired t-test, p < 0.05). The systolic (126.3 ± 4.1 vs. 120.0 ± 3.2 mmHg) and diastolic pressure (77.6 ± 2.5 vs. 74.3 ± 1.9 mmHg) (paired t-test, p < 0.05) decreased in the ES group.

Conclusions: The systemic effect of L-arginine was observed. Improved cardiovasular function in response to L-arginine could justify the use of dietary L-arginine supplementation.
