PREFACE

Motivated by the recent vigorous research activity in nonlinear water waves and some related significant new results, the international conference “Mathematical Aspects of Water Waves” took place at King’s College London from 15–17 March 2012. The aim of the conference was to bring together specialists from several independent international research groups and to make the connection between theory, numerical simulations and experiments. The talks of the 25 speakers from 8 countries offered an overview on the current status of water wave theory, including significant progress on some outstanding open problems. The collection of papers in this special issue of the journal reflects the topics that were discussed at this conference.
