Abstract—The triangle inequality is one of the most important and fundamental inequalities in analysis. Many authors have been treating its generalizations and reverse inequalities. In this paper, we shall present the sharp triangle inequality and its reverse inequality for an arbitrary number of finitely many nonzero elements of a quasi-Banach space, which generalize the results obtained by C. Wu and Y. J. Li in [1].

Keywords—Triangle inequality; Sharp triangle inequality; Reverse inequality; Norm; Quasi-Banach spaces

I. INTRODUCTION

The triangle inequality is one of the most fundamental inequalities in analysis and has been treated by many authors (see [2], [3], [4], [6] among others). Recently C. Wu and Y. J. Li [1] showed the following sharp triangle inequality and its reverse inequality in a quasi-Banach space.

Theorem I.1. For all nonzero elements \( x, y \) in a quasi-Banach space \( X \) with \( \| x \| \geq \| y \| \), then

\[
\| x + y \| \geq C \left( 2 - \frac{x}{\| x \|} + \frac{y}{\| y \|} \right) \| y \| \\
\leq C (\| x \| + \| y \|) \\
\leq \| x \| + 2C^2 \left( \frac{x}{\| x \|} + \frac{y}{\| y \|} \right) \| x \|,
\]

where \( C \) is a constant and \( C \geq 1 \).

Let us recall some basic facts concerning the quasi-Banach spaces and some preliminary results (see [7] for more information about the quasi-Banach spaces).

Definition I.2. (see [7]) Let \( X \) be a linear space. A quasi-norm is a real-valued function on \( X \) satisfying the following:

1. \( \| x \| \geq 0 \) for all \( x \in X \) and \( \| x \| = 0 \) if and only if \( x = 0 \);
2. \( \| \lambda x \| = |\lambda| \| x \| \) for all \( \lambda \in \mathbb{R} \) and all \( x \in X \);
3. There is a constant \( K \geq 1 \) such that \( \| x + y \| \leq K \left( \| x \| + \| y \| \right) \) for all \( x, y \in X \).

The pair \( (X, \| \cdot \|) \) is called a quasi-normed space if \( \| \cdot \| \) is a quasi-norm on \( X \).

A quasi-Banach space is a complete quasi-normed space.

A quasi-norm \( \| \cdot \| \) is called a \( p \)-norm \((0 < p \leq 1)\) if

\[
\| x + y \|^p \leq \| x \|^p + \| y \|^p
\]

for all \( x, y \in X \). In this case, a quasi-Banach space is called a \( p \)-Banach space.

In this paper, we shall generalize the inequalities (1) and (2) for an arbitrary number of finitely many nonzero elements of a quasi-Banach space.

II. MAIN RESULTS

Theorem II.1. For all nonzero elements \( x_1, x_2, \ldots, x_n \) in a quasi-Banach space \( X \) with \( \| x_1 \| \geq \| x_2 \| \geq \cdots \geq \| x_n \| \), then

\[
\left\| \sum_{j=1}^{n} \frac{x_j}{\| x_j \|} \right\| \\
\leq K \left( \sum_{j=1}^{n} \frac{x_j}{\| x_j \|} \right) + K^2 \left( \frac{1}{\| x_1 \|} - \frac{1}{\| x_1 \|} \right) x_j
\]

where \( C \) is a constant and \( C \geq 1 \).

Proof: We follow the method of proof [8, Theorem 2.1], but make some essential modifications to it. First, let us see inequality (4): for a fixed \( i \in \{1, \cdots, n\} \), we have

\[
\left\| \sum_{j=1}^{n} \frac{x_j}{\| x_j \|} \right\| \\
\leq K \left( \sum_{j=1}^{n} \frac{x_j}{\| x_j \|} \right) + K^2 \left( \frac{1}{\| x_1 \|} - \frac{1}{\| x_1 \|} \right) x_j
\]

Hence, in order to prove inequality (4), let us set \( C = \prod_{j=1}^{n} K_j \), where \( K_j = K \) for all \( 1 \leq j \leq n \). Thus,
from the above inequality it follows that
\[ \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \leq C \left( \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} + C \sum_{j=1}^{n} \frac{1}{\|x_j\|} - \frac{1}{\|x_j\|} \right) \|x_j\| \]
\[ = C \left( \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} + \sum_{j=1}^{n} (\|x_j\| - \|x_i\|) \right). \]

Let \( x_i = x_i \). From the above inequality we get
\[ \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \leq C \left( \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} + \left( \sum_{j=1}^{n} \|x_j\| - \sum_{j=1}^{n} \|x_j\| \right) \right). \]
From this it follows that
\[ C \sum_{j=1}^{n} \|x_j\| \leq C \sum_{j=1}^{n} x_j + (nC - \sum_{j=1}^{n} \frac{x_j}{\|x_j\|}) \|x_j\|, \]
which is inequality (4).

In order to prove inequality (3), we proceed in a similar way. For a fixed \( i \in \{1, \cdots, n\} \), we have
\[ \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| = \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} + \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \left( \sum_{j=1}^{n} \frac{1}{\|x_j\|} - \frac{1}{\|x_i\|} \right) \]
\[ = \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} - \sum_{j=1}^{n} \left( \frac{1}{\|x_j\|} - \frac{1}{\|x_i\|} \right) x_j \]
\[ \geq \frac{1}{K} \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} - \sum_{j=1}^{n} \left( \frac{1}{\|x_j\|} - \frac{1}{\|x_i\|} \right) x_j \].
From this it follows that
\[ K \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \geq \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} - K \sum_{j=1}^{n} \left( \frac{1}{\|x_j\|} - \frac{1}{\|x_i\|} \right) x_j \]
\[ \geq \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} - K^2 \left( \frac{1}{\|x_i\|} - \frac{1}{\|x_i\|} \right) x_j \]
\[ = K^2 \sum_{j=1}^{n} \left( \frac{1}{\|x_j\|} - \frac{1}{\|x_j\|} \right) x_j . \]

Hence, in order to prove inequality (3), let us set
\[ C = \prod_{j=1}^{n} K_j \], where \( K_j = K \) for all \( 1 \leq j \leq n \). Thus, from the above inequality it follows that
\[ C \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \geq \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} - C \sum_{j=1}^{n} \frac{1}{\|x_j\|} - \frac{1}{\|x_j\|} \|x_j\| \]
\[ = \frac{1}{\|x_i\|} \sum_{j=1}^{n} x_j - C \sum_{j=1}^{n} \|x_j\| - \|x_i\| \].
Let \( x_i = x_i \). From the above inequality we get
\[ C \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \geq \frac{1}{\|x_i\|} \sum_{j=1}^{n} x_j - C \sum_{j=1}^{n} (\|x_j\| - \|x_i\|) \]
\[ \geq \frac{1}{\|x_i\|} \sum_{j=1}^{n} x_j - C \sum_{j=1}^{n} x_j + nC. \]
From this it follows that
\[ C \left\| \sum_{j=1}^{n} \frac{x_j}{\|x_j\|} \right\| \|x_n\| \geq \sum_{j=1}^{n} x_j - C \sum_{j=1}^{n} x_j + nC \|x_n\|. \]
Therefore
\[ \left\| \sum_{j=1}^{n} x_j \right\| + C \left( n - \sum_{j=1}^{n} \left\| x_j \right\| \right) \|x_n\| \leq C \sum_{j=1}^{n} \left\| x_j \right\|. \]
This completes the proof.

In fact, by the proof of Theorem (II.1) above, we can get the following results:

**Theorem II.2.** For all nonzero elements \( x_1, x_2, \ldots, x_n \) in a quasi-Banach space X
\[ \left\| \sum_{j=1}^{n} x_j \right\| + C \left( n - \sum_{j=1}^{n} \left\| x_j \right\| \right) \|x_n\| \leq C \sum_{j=1}^{n} \left\| x_j \right\|. \]

**Remark II.3.** Notice that, when \( n = 2 \) in Theorem (II.1) above, we can get the inequalities (1) and (2) obtained by C. Wu and Y. J. Li in [1], which are evident from the results of our Theorem (II.1) and the proof of [1, Theorem 2.1](i.e., Theorem I.1 above), here we omit it.
