Abstract

In this paper, the notion of strong prime LI-ideals (briefly, SPLI-ideals) of lattice implication algebras is introduced. The relations between SPLI-ideals and prime LI-ideals, between SPLI-ideals and maximal proper LI-ideals, between SPLI-ideals and the finite union property, and between ultra-filter and SPLI-ideal are investigated. Finally, we conclude that SPLI-ideals are equivalent to maximal proper LI-ideals.

Key words: Lattice implication algebra, Prime LI-ideal, SPLI-ideal, Finite union property

1. Introduction

Non-classical logic has become a considerable formal tool for computer science and artificial intelligence to deal with fuzzy information and uncertainty information. Many-valued logic, a great extension and development of classical logic, has always been a crucial direction in non-classical logic. In order to research the many-valued logic system whose propositional value is given in a lattice, in 1990 Xu [1] proposed the concept of lattice implication algebra. Since then this logical algebra has been extensively investigated by several researchers (see e.g. [12]-[17]). In [9] Xu and Qin introduced the notions of filters and implicative filters in lattice implication algebras, and investigated their some properties. In a lattice implication algebra, filters are important substructures, they play a significant role in studying the structure and the properties of lattice implication algebras. In[11], Jun et al. introduced the notions of positive implicative filters and associative filters in lattice implication algebras, and investigated their some properties. In[4], Jun et al. defined the notion of LI-ideals in lattice implication algebras and investigated its some properties. In[5], Jun defined the notion of prime LI-ideals in lattice implication algebras and investigated its some properties. In this paper, as an extension of above-mention work we introduce the notions of strong prime LI-ideals in lattice implication algebras, and investigated its some properties. In Section 2, we list some basic information on the lattice implication algebras which is needed for development of this topic. In Section 3, we introduce the notion of the union property of lattice implication algebras. We give the sufficient and necessary condition that a proper LI-ideal to have the union property. In section 4, we introduce the notion of strong prime LI-ideals (briefly, SPLI-ideals) of lattice implication algebras, and talk about the relations between SPLI-ideals and prime LI-ideals, between SPLI-ideals and maximal proper LI-ideals, between SPLI-ideals and the finite union property, and between ultra-filter and SPLI-ideal. We prove that SPLI-ideals are equivalent to maximal proper LI-ideals.

2. Preliminaries

Definition 2.1[1] Let \((L,\lor,\land,O,I)\) be a bounded lattice with an order-reversing involution \(\neg\), \(I\) and \(O\) the greatest and the smallest element of \(L\) respectively, and
\[
\rightarrow : L \times L \rightarrow L
\]
be a mapping. \((L,\lor,\land,\rightarrow,O,I)\) is called a lattice implication algebra if the following conditions hold for any \(x,y,z \in L\):
\[
\begin{align*}
(L_1) & \quad x \rightarrow (y \rightarrow z) = y \rightarrow (x \rightarrow z), \\
(L_2) & \quad x \rightarrow x = I, \\
(L_3) & \quad x \rightarrow y = y' \rightarrow x', \\
(L_4) & \quad \text{if } x \rightarrow y = y \rightarrow x = I, \text{ then } x = y, \\
(L_5) & \quad (x \rightarrow y) \rightarrow y = (y \rightarrow x) \rightarrow x, \\
(L_6) & \quad (x \lor y) \rightarrow z = (x \rightarrow z) \land (y \rightarrow z), \\
(L_7) & \quad (x \land y) \rightarrow z = (x \rightarrow z) \lor (y \rightarrow z),
\end{align*}
\]
A lattice implication algebra is called a lattice \(H\)-implication algebra if it satisfies
\[
x \lor y \lor (x \land y) \rightarrow z = I.
\]
In a lattice implication algebra \(L\), [3] defines two binary operations \(\otimes\) and \(\oplus\) as follows: for any \(x,y \in L\),
\[
\begin{align*}
x \otimes y & = (x \rightarrow y'), \\
x \oplus y & = x' \rightarrow y.
\end{align*}
\]
In a lattice implication algebra \(L\), the following hold:
\[
\begin{align*}
(L_8) & \quad x \rightarrow (y \rightarrow z) = (x \otimes y) \rightarrow z, \\
(L_9) & \quad (x \oplus y) = x' \otimes y', \\
(L_{10}) & \quad (x \otimes y) = x' \otimes y', \\
(L_{11}) & \quad O \otimes x = O, \quad I \oplus x = x, \quad x \otimes x' = O;
\end{align*}
\]
\((L_{12}) O \oplus x = x, \ I \oplus x = I, \ x \oplus x' = I, \)
\((L_{13}) O \to x = I, \ x \to O = x', \)
\((L_{14}) I \to x = x, \ x \to I = I, \)
\((L_{15}) x \leq y \text{ if and only if } x \to y = I.\)

**Definition 2.2** [3] Let \(L\) be a lattice implication algebra. An \(LI\)-ideal \(A\) is a non-empty subset of \(L\) such that for any \(x, y \in L,
\((L_{1}) O \in A, \)
\((L_{2}) (x \to y) \in A \text{ and } y \in A \implies x \in A.\)
In a lattice implication algebra, \(A \subseteq L,\) the least \(LI\)-ideal containing \(A\) is called the \(LI\)-ideal generated by \(A\) and denoted by \(\langle A \rangle.\) Specially, if \(A = \{a\},\) we write \(\langle \{a\} \rangle\) as \(\langle a \rangle.\)

**Definition 2.3** [9] Let \(L\) be a lattice implication algebra, \(J \subseteq L\) is said to be a filter of \(L,\) if it satisfies the following conditions:
\((J_{1}) f \in J,\)
\((J_{2}) \text{ for any } x, y \in L, \text{ if } x \in J \text{ and } (x \to y) \in J, \text{ then } y \in J.\)

For any non-empty subset \(A\) of a lattice implication algebra, let \(A' = \{x \mid x \in A\}.\)
We show the relation between \(LI\)-ideal and filter of lattice implication algebra.

**Theorem 2.4** [3] Let \(A\) be a non-empty subset of a lattice implication algebra \(L,\) then \(A\) is a filter of \(L\) if and only if \(A'\) is an \(LI\)-ideal of \(L.\)

**Definition 2.5** [10] Let \(L\) be a lattice implication algebra, a filter \(J\) of \(L\) is called an ultra-filter if for any \(x \in L, \text{ if } x \in J \text{ and only if } x' \notin J.\)

**Definition 2.6** [5] Let \(L\) be a lattice implication algebra, \(P\) a proper \(LI\)-ideal of \(L,\) \(P\) is called a prime \(LI\)-ideal if \(x \land y \in P\) implies \(x \in P\) or \(y \in P.\)

**Definition 2.7** [3] Let \(L_{1}\) and \(L_{2}\) be lattice implication algebras, \(f : L_{1} \to L_{2}\) a mapping from \(L_{1}\) to \(L_{2},\) if
\[ f(x \to y) = f(x) \to f(y) \]
holds for any \(x, y \in L_{1},\) then \(f\) is called an implication homomorphism from \(L_{1}\) to \(L_{2}.\) If an implication homomorphism \(f\) is a surjection, then it is called an implication epimorphism. If \(f\) is an implication homomorphism and satisfies
\[ f(x \lor y) = f(x) \lor f(y), \]
\[ f(x \land y) = f(x) \land f(y), \]
\[ f(x') = (f(x))', \]
then \(f\) is called a lattice implication homomorphism from \(L_{1}\) to \(L_{2}.\)

### 3. The union property of lattice implication algebras

**Definition 3.1** Let \(L\) be a lattice implication algebra. \(A \subseteq L\) is said to have the union property if for any \(a_{1}, a_{2}, \ldots, a_{n} \in A,\)
\[ a_{1} \oplus a_{2} \oplus \cdots \oplus a_{n} < I. \]
In what follows,
\[ [a_{1}, a_{2}, \ldots, a_{n}] = a_{1} \to (a_{2} \to \cdots \to (a_{n} \to x) \cdots)).\]
Specially,
\[ [a, x] = x, \]
\[ [a, x] = [a, x] = a \to x, \]
\[ [a, x] = a \to (a \to (\cdots \to (a \to x) \cdots)) \]
\[ n \geq 2. \]

**Lemma 3.2** [3] If \(A\) is a non-empty subset of a lattice implication algebra \(L,\) then
\[ \langle A \rangle = \{x \mid x \in L, \text{ there exist } a_{1}, \ldots, a_{n} \in A, \text{ s.t., } a_{1} \oplus \cdots \oplus a_{n} \geq x \}. \]

**Theorem 3.3** Let \(L\) be a lattice implication algebra, \(\emptyset \neq A \subset L.\) Then
\[ \langle A \rangle = \{x \mid x \in L, \text{ there exist } a_{1}, \ldots, a_{n} \in A, \text{ s.t., } a_{1} \oplus \cdots \oplus a_{n} \geq x \}. \]

**Proof.** By
\[ \langle a_{1}, \ldots, a_{n}, x' \rangle = I \]
\[ \iff a_{1}' \to (\cdots \to a_{n}' \to x') \cdots = I \]
\[ \iff \langle a_{1} \oplus \cdots \oplus a_{n} \rangle \to x' = I \text{ (by L8)} \]
\[ \iff x \to (a_{1} \oplus \cdots \oplus a_{n}) = I \]
\[ \iff a_{1} \oplus \cdots \oplus a_{n} \geq x, \]
and by Lemma 3.2, we complete the proof.

**Theorem 3.4** Let \(L\) be a lattice implication algebra. \(A \subseteq L,\) then \(\langle A \rangle\) is a proper \(LI\)-ideal if and only if \(A\) has the finite union property.

**Proof.** Suppose \(\langle A \rangle\) is a proper \(LI\)-ideal, and it doesn’t have the finite union property. So there exist \(a_{1}, a_{2}, \ldots, a_{n} \in A,\) \(s.t., a_{1} \lor a_{2} \lor \cdots \lor a_{n} \geq I,\) by Theorem 3.3, \(I \in \langle A \rangle,\) contradiction.

Conversely, suppose that \(A\) has the finite union property, then for any \(a_{1}, a_{2}, \ldots, a_{n} \in A,\)
\(a_{1} \lor a_{2} \lor \cdots \lor a_{n} < I,\) so \(I \notin A\) and \(A\) is a proper \(LI\)-ideal.

**Theorem 3.5** Let \(L\) be a lattice implication algebra, \(a,b,x \in L.\)

1. If \(a \geq b,\) then \(\langle a' \rangle \geq \langle b' \rangle\) for any \(n \in N,\)
2. If \(n,m \in N, \ n \geq m,\) then \(\langle a' \rangle \geq \langle a' \rangle^{\text{m}},\)
3. \(\langle a' \rangle \geq \langle x' \rangle\) for any \(n \in N.\)

**Proof.** These conclusions are trivial when \(n=0\) or \(m=0.\)

(1) we use induction over \(n\) to show
It follows that there exists an element $B \neq yA$ such that:

$yL \rightarrow \exists x \in b'x' \in L \cup \{x\}$.

Suppose now $n > 1$, and $[a', x'] \in [b', x']$ for any $m = n$, then when $m = n > 1$,

$[a', x']^{m,p} = a' \rightarrow [a', x']^{m,p} \subseteq [b', x']^{m,p} \rightarrow b' \rightarrow [b', x']^{m,p} = [b', x']^{m,p}$.

(2) Suppose that $n = m + k$. It follows that $p \geq 0$. We use induction on $p$ to show $[a', x']^{m,p} \subseteq [a', x']^{m,p}$. If $p = 0$, then $[a', x']^{0,p} \subseteq [a', x']^{0,p}$ holds.

Suppose now $p = 1$, then

$[a', x']^{m,p} = a' \rightarrow [a', x']^{m,p} \subseteq O' \rightarrow [a', x']^{m,p} = [a', x']^{m,p}$.

Suppose now $p = 1$, and $[a', x']^{m,p} \subseteq [a', x']^{m,p}$ for any $q = p$. It follows that

$[a', x']^{m,q} = a' \rightarrow [a', x']^{m,q} \subseteq a' \rightarrow [a', x']^{m,q} \subseteq [a', x']^{m,q}$.

(3) When $n = 1$, then $[a', x'] = a' \rightarrow x' = x \rightarrow a \geq x \rightarrow O = x$.

Suppose that $n = m$, and $[a', x'] \subseteq x'$ holds for any $m \in N$. It follows that

$[a', x']^{m} = a' \rightarrow [a', x']^{m} \subseteq O' \rightarrow [a', x']^{m} \subseteq O' \rightarrow x' = x$.

Complete the proof.

4. SPLI-ideals of lattice implication algebras

**Definition 4.1** Let $L$ be a lattice implication algebra. A proper $LI$-ideal $A$ is said to be a strong prime $LI$-ideal (briefly, SPLI-ideal) if

$(x \otimes y) \in A$ implies $x \in A$ or $y \in A$ for any $x, y \in L$.

The relation between SPLI-ideals and prime $LI$-ideals in lattice implication algebras is as follows:

**Theorem 4.2** A SPLI-ideal is a prime $LI$-ideal.

**Proof.** Let $A$ be a SPLI-ideal, we need to prove that if $x \land y \in A$ implies $x \in A$ or $y \in A$, in fact, by $x \otimes y = x \land y \leq x \land y \otimes x \land y$, we get $x \otimes y \in A$, because $A$ is a SPLI-ideal, so $x \in A$ or $y \in A$.

The relation between SPLI-ideals and maximal proper $LI$-ideals in lattice implication algebras is as follows:

**Theorem 4.3** Let $L$ be a lattice implication algebra, $A \subseteq L$. The following statements are equivalent:

1. $A$ is a SPLI-ideal;
2. $A$ is a maximal proper $LI$-ideal.

**Proof.** (1) $\Rightarrow$ (1). Suppose that $A$ is a SPLI-ideal, so $A$ is a proper $LI$-ideal, if $A \subset B$ and $B$ is also a proper $LI$-ideal, we need to prove $A = B$. In fact, if there exist $x \in B$ such that $x \notin A$, then by $x \otimes x' = O \in A$, so $x' \in A \subset B$, i.e. $I \rightarrow x \in B$, it follows that $I \in B$, and $B = L$, which is a contradiction.

(1) $\Rightarrow$ (1). Suppose $A$ is a maximal proper $LI$-ideal. We need to prove that $x \otimes y \in A$ implies $x \in A$, or $y \in A$ for any $x, y \in L$. Otherwise, if $x \otimes y \in A$, but $x \notin A$ and $y \notin A$. Let $B = A \cup \{x\}, D = \{B\}$, we shall prove that $B$ has the union property. In fact, for any $y_1, \ldots, y_n \in B$,

(a) If $y_1, \ldots, y_n \in A$, then $y_1 \otimes \ldots \otimes y_n \in A$ by $LI$-ideals are closed with the operation $\otimes$, it follows that $y_1 \otimes \ldots \otimes y_n \notin B$ because $A$ is a proper $LI$-ideal.

(b) If there exist $i < n$ such that $y_i = x$, without losing generality suppose $y_i = x$. If $y_1 \otimes \ldots \otimes y_n = x \otimes \ldots \otimes y_n = x \rightarrow (y_2 \otimes \ldots \otimes y_n) = I$ then $x' \leq y_1 \otimes \ldots \otimes y_n$, so $x' \in A$. By supposition, $x \otimes O = O \in A$ implies $x \notin A$ and $x' \notin A$, a contradiction.

By (a) and (b), we have proved that $B$ has the finite union property, so $\{B\}$ is a proper $LI$-ideal, it follows by $A \subset \{B\}$ that $A = \{B\}$, i.e $A = A \cup \{x\}$, that is $x \in A$, conflict.

The relation between SPLI-ideals and the finite union property in lattice implication algebras is as follows:

**Theorem 4.4** Let $L$ be a lattice implication algebra, $A \subseteq L$. If $A$ has the finite union property, then there exist a SPLI-ideal $B$ such that $A \subseteq B$.

**Proof.** Let $E = \{B \mid A \subset B, B$ is a prime $LI$-ideal of $L\}$. It follows that $E \neq \emptyset$ because $\{A\} \in E$. Suppose that $B_i \in E$ for any $i < k$ such that:

1. $A \subset B$;
2. $I \notin B$ because $I \notin B_i$ for any $i < k$;
3. $O \notin B$;
4. $y_i(x \rightarrow y) \in B$, then there exists $i < k$ such that $y_i(x \rightarrow y) \in B$, it follows that $x \in B \subseteq B$. So, $B$ is a proper $LI$-ideal and $B \in E$.

It follows by Zorn’s Lemma that $E$ has a maximal element $B$. Thus $B$ is a strong prime $LI$-ideal such that $A \subseteq B$.

From the theorem 4.4, we have the following corollary.

**Corollary 4.5** Any proper $LI$-ideal of $L$ can be extended to a SPLI-ideal.

**Theorem 4.6** If $A$ is a prime $LI$-ideal of lattice $H$ implication algebra $L$, then $A$ is a SPLI-ideal.

**Proof.** Suppose that $A$ is not a SPLI-ideal of $L$. Then there exist a proper $LI$-ideal $F$ of $L$ such that $A \subset F$ and $A \neq F$. It follows that there exists an element $a \in F$ such that $a \notin A$. We get $x \land a' = O \in A$, it follows that $a' \in A \cup F$, this implies that $a' \in F$, which contradicts to that $F$ is a proper $LI$-ideal.

From the theorem 4.6, we have the following corollary.

**Corollary 4.7** In a lattice $H$ implication algebra, the concept of prime $LI$-ideal and SPLI-ideal coincide.

**Theorem 4.8** Let $L_1$ and $L_2$ be lattice implication algebras, $f : L_1 \rightarrow L_2$ is a lattice implication
homomorphism from $L_1$ to $L_2$. If $A$ is a SPLI-ideal of $L_2$, then $f^{-1}(A)$ is a SPLI-ideal of $L_1$.

**Proof.** For any $x, y \in L_1$, if 
\[(x \to y')' \in f^{-1}(A),\]
then
\[f\left(f\left(x \to y'\right)\right) \in A,
\]
by Definition 2.7, we have
\[(f(x) \to f(y'))' \in A,
\]
i.e.
\[(f(x) \to f(y'))' \in A,
\]
and then
\[f\left(f\left(x \to f\left(y'\right)\right)\right) \in A,
\]
for $A$ is a SPLI-ideal of $L_2$, then $f(x) \in A$ or $f(y') \in A$, so $x \in f^{-1}(A)$ or $y' \in f^{-1}(A)$. By Definition 4.1, $f^{-1}(A)$ is a SPLI-ideal of $L_1$.

**Lemma 4.9** [3] Let $L$ be a lattice implication algebra, $J$ a proper filter of $L$. $J$ is an ultra-filter if and only if $x \otimes y \in J$ implies $x \in J$ or $y \in J$ for any $x, y \in L$.

Finally, we give the relation between ultra-filter and SPLI-ideal as follows:

**Theorem 4.10** Let $L$ be a lattice implication algebra, $A$ a non-empty subset of $L$, let
\[A' = \{x' \mid x \in A\},\]
then $A$ is an ultra-filter if and only if $A'$ is a SPLI-ideal of $L$.

**Proof.** Suppose that $A$ is an ultra-filter. For any $x', y' \in L$, if $x' \otimes y' \in A'$, i.e., $(x \otimes y) \in A'$ (by $L_0$), then $x \otimes y \in A$. By Lemma 4.9, we get $x \in A$ or $y \in A$, and hence $x' \in A'$ or $y' \in A'$. So by Definition 4.1, $A'$ is a SPLI-ideal.

Conversely, suppose that $A'$ is a SPLI-ideal, for any $x, y \in L$, if $x \otimes y \in A$, then $(x \otimes y) \in A'$, i.e., $x' \otimes y' \in A'$, so $x' \in A'$ or $y' \in A'$. Hence $x \in A$ or $y \in A$, and $A$ is an ultra-filter.

5. Conclusions

In order to research the many-valued logical system whose propositional value is given in a lattice, Xu initiated the concept of lattice implication algebra. Hence for development of this many-valued logical system, it is needed to make clear the structure of an algebraic system. It is well known that to investigate the structure of an algebraic system, the ideals with special properties play an important role. In this paper, we proposed the notion of strong prime LI-ideals (SPLI-ideals) in lattice implication algebras, discussed the relations between SPLI-ideals and prime LI-ideals, between SPLI-ideals and maximal proper LI-ideals, and between ultra-filter and SPLI-ideal. We finally concluded that SPLI-ideals are equivalent to maximal proper LI-ideals. Actually, SPLI-ideal is the dual of ultra-filter. It hope above work would serve as a foundation for further study the structure of lattice implication algebras and develop corresponding many-valued logical system.
