Keywords: D-A type molecules; carbazole; Knevenagel reaction

Abstract: Aliphatic chains and cyanoacetic acid could improve the solubility and the optical and electrical properties of small molecules. Novel D-A type conjugated organic molecules composed of central carbazole units and cyanoacetic acid terminal groups have been designed and constructed. Optical properties, electrical Properties and thermodynamic properties will be studied in future work. The target compounds would be promising candidates for organic light-emitting diodes.

Introduction

The D-A type molecules have attracted a variety of attention during the past decade due to their great potential electronic and optoelectronic applications in photovoltaic cells, electrochromic cells and organic light-emitting diodes.¹ Comparing with organic polymers, conjugated organic molecules have great advantages on higher purity, fixed molecular weight and their clear molecular structure, which will receive a significant amount of interest by researchers in the coming years.² Especially, those with donor-acceptor (D-A) architectures, play an key role in organic materials leading to desirable semiconductor properties for electrical and optical applications.

Carbazole and its derivatives have many great properties such as rigid plane, long conjugation length, good hole transporting properties and charge transporting compounds creating free carriers in the visible region through the photo-carrier generation process. So those often been applied to biochemical fluorescent technology, electrogenerated chemiluminescence, organic light emitting diodes (OLEDs), and photovoltaic cells.³-⁵

Herein, we design and synthesize new compounds (2E,2'E)-3,3'-(5,5'-(9-octyl-9H-carbazole-3,6-diyl)bis(thiophene-5,2-diyl))bis(2-cyanoacrylic acid), based on carbazole units at the center and introduced cyanoacetic acid group and thiophene to improve electronic and optical properties of organic conjugated molecules. The target compounds would be promising candidates for organic light-emitting diodes. Optical properties, electrical Properties and thermodynamic properties will be studied in future work.

Experimental Section

Characterization: ¹H NMR and ¹³C NMR spectra were collected on a Bruker AM-400WB spectrometer in chloroform-d or DMSO as solvent and tetramethylsilane (TMS) as the internal standard. Materials: Diethyl ether and tetrahydrofuran (THF) were dried over sodium benzophenone and distilled under argon atmosphere before use. CHCl₃ and DMF were dried over CaH₂ and then distilled under nitrogen atmosphere and deoxygenated by purging with nitrogen for 30 min before use in monomer synthesis. Other chemicals were purchased from Acros and used without further purification.
as the eluent. The product was obtained as yellow solids. Yield: 0.8 g, (84%). 1H NMR (400 MHz, CDCl3, ppm): δ = 9.89 (s, 2H), 8.39 (s, 2H), 7.79 (d, J =10.1 Hz, 4H), 7.44 (m, 4H), 4.29 (t, J = 6.6 Hz, 2H), 1.81 (t, J = 6.6 Hz, 2H), 1.23−1.15 (m, 10H), 0.80 (t, J = 6.4 Hz, 3H). 13C NMR (100 MHz, CDCl3): δ 154.67, 140.52, 136.80, 123.97, 122.16, 117.65, 108.74, 42.50, 30.73, 29.90, 28.26, 26.23, 21.56, 13.03.

In our previous paper, compounds 2 and 3 have been constructed via the Susuki coupling reaction and the Vilsmeier-Haack reaction, respectively, as shown in Scheme 1. Firstly, 3,6-dibromo-9H-carbazole and 1-bromo-octane reacted in DMSO under a mild condition and simple purification process to give 1 in 86% yield. Then, 3,6-dibromo-9-octyl-9H-carbazole, 2.5 equiv. of tributyl (thiophen-2-yl)stannane and Pd(PPh3)2Cl2 used as a catalyst in toluene afforded 2 in a yield of 78% after multiple reaction route selections. At last, DMF and POCl3 were added to 2 to get 3 in 84% yield.

**Synthesis of 3,6-dibromo-9-octyl-9H-carbazole (1)**

3,6-dibromo-9H-carbazole (2.0 g, 6.15 mmol) and 1-bromo-octane (1.43 g, 7.38 mmol) were dissolved in DMSO (40 ml) and stirred for 30 min at room temperature. A sodium hydroxide solution (5 ml, v: 50%) was slowly added and then stirred for overnight at room temperature. Then the reaction mixture was poured into water. The precipitate was filtered, repeatedly washed with distilled water and dried under vacuum. The product was obtained as off-white solids without further purifications. Yield: 2.3 g, (86 %).

**Synthesis of 9-octyl-3,6-di(thiophen-2-yl)-9H-carbazole (2)**

A mixture of 3,6-dibromo-9H-carbazole (0.50 g, 1.14 mmol), tributyl(thiophen-2-yl)stannane (1.07 g, 2.86 mmol), and Pd(PPh3)2Cl2 (0.09 g, 0.13 mmol) in dry toluene (30 ml) was stirred at 115 °C under N2 for 24 h. After cooling the mixture to the room temperature, the solvent was directly removed. The crude product was purified using column chromatography on a silica gel with petroleum ether as the eluent. The product was obtained as white solid. Yield: 0.40 g, (78%). 1H NMR (400 MHz, CDCl3, ppm): δ = 8.08 (s, 2H), 7.48 (d, J = 8.8 Hz, 2H), 7.20 (d, J = 7.2 Hz, 2H), 4.16 (t, J=6.8 Hz, 2H), 1.74 (d,J = 6.4 Hz, 2H), 1.23−1.15 (m, 10H), 0.79 (t, J = 6.4 Hz, 3H). 13C NMR (100 MHz, CDCl3): δ 138.00, 127.76, 122.77, 111.03, 109.01, 42.06,30.69, 28.15, 27.72, 26.11, 21.54, 13.04.

**Synthesis of 5,5’-(9-octyl-9H-carbazole-3,6-diyl)bis(thiophene-2-carbaldehyde) (3)**

3,6-dibromo-9H-carbazole (0.50 g, 1.14 mmol), tributyl(thiophen-2-yl)stannane (1.07 g, 2.86 mmol), and Pd(PPh3)2Cl2 (0.09 g, 0.13 mmol) in dry toluene (30 ml) was stirred at 115 °C under N2 for 24 h. After cooling the mixture to the room temperature, the solvent was directly removed. The crude product was purified using column chromatography on a silica gel with petroleum ether as the eluent. The product was obtained as white solid. Yield: 0.8 g, (84%). 1H NMR (400 MHz, CDCl3, ppm): δ = 9.89 (s, 2H), 8.39 (s, 2H), 7.79 (d, J =10.1 Hz, 4H), 7.44 (m, 4H), 4.29 (t, J = 6.6 Hz, 2H), 1.81 (t, J = 6.6 Hz, 2H), 1.23−1.15 (m, 10H), 0.80 (t, J = 6.4 Hz, 3H). 13C NMR (100 MHz, CDCl3): δ 181.57, 154.67, 140.52, 136.80, 123.97, 122.16, 117.65, 108.74, 42.50, 30.73, 29.90, 28.26, 26.23, 21.56, 13.03.
Synthesis of (2E,2’E)-3,3’-(5,5’-(9-octyl-9H-carbazole-3,6-diyl)bis(thiophene-5,2-diyl))bis(2-cyanoacrylic acid) (4)

A mixture of 5,5’-(9-octyl-9H-carbazole-3,6-diyl)bis(thiophene-2-carbaldehyde) (3) (0.45 g, 0.9 mmol), 2-cyanoacetic acid (0.23 g, 2.7 mmol), ammonium acetate (0.21 g, 2.7 mmol) in AcOH (45 mL) was stirred for 12 h at 120 °C under N₂. After it was cooled to room temperature, the reaction mixture was poured into ice water then filtered. The product was obtained as red solid. Yield: 0.47 g (82 %). ¹H NMR (400 MHz, DMSO) δ 8.75 (s, 2H), 8.47 (s, 2H), 8.02 (d, J = 3.6 Hz, 2H), 7.88 (d, J = 8.4 Hz, 2H), 7.80 (d, J = 3.8 Hz, 2H), 7.70 (d, J = 8.5 Hz, 2H), 4.40 (s, 2H), 1.76 (s, 2H), 1.20 (m, 11H), 0.79 (t, J = 6.6 Hz, 3H). ¹³C NMR (101 MHz, DMSO) δ 164.03, 154.80, 146.45, 141.39, 133.58, 124.94, 124.08, 122.76, 119.01, 116.85, 110.54, 97.44, 42.68, 31.23, 30.73, 28.6, 26.47, 22.08, 13.93.

Conclusions

In conclusion, the target compound 4 has been successfully prepared via the Knevenagel reaction in acceptable yields with a much milder and more efficient route, were designed to construct novel donor-acceptor conjugated organic molecules based on central carbazole units as electronic donors and cyanoacetic acid terminal groups as electronic acceptors. Optical properties, electrical Properties and thermodynamic properties will be studied in future work.
