Keywords: Radon Transform; Wave Field Separation; Least-square Inversion

Abstract. In order to offer a more effective method to separate wave field, this article studies linear and high resolution nonlinear Radon transform respectively, and discusses Radon transform from continuation and discrete. The program compiled by MATLAB can achieve linear and nonlinear Radon transform. The results show that program in this article is useful and efficient, and nonlinear Radon transform suppresses the smearing effect, greatly improves the resolution.

Introduction

Radon transform was put forward by Radon initially in 1917, which provides a mathematic base for image reconstruction in physics, astronomy, medical science, optics, molecular biology[1]. Fourier projection theory testifies the equal relationship between Radon transform and Fourier transform, and Radon transform is more effective in wave field separation[2][3]. In three-component seismic reflection data, wave field separation is an important issue which has great influence on interpretation and imaging[4]. Radon transform transforms data from an old filed into a new filed, and separates each component in the new filed, reserves the useful section[5].

This article studies linear and high resolution nonlinear Radon transform respectively, and the program compiled by MATLAB shows that nonlinear Radon transform suppresses the smearing effect, greatly improves the resolution.

Linear Radon transform and nonlinear Radon transform

Continuous Linear Radon transform

\( u(h, t) \) is seismic signals, \( t \) is time, \( h \) is offset, \( v(\tau, p) \) is the model value in \( \tau - p \) field, \( \tau \) is time intercept, \( p \) is slope. Anti-slant stack is as follows:

\[
    u(h, t) = \int_{-\infty}^{\infty} v(p, \tau = t - hp) \, dp
\]

(1)

Adjoint transform is as follows:

\[
    \tilde{v}(p, \tau) = \int_{-\infty}^{\infty} u(h, t = \tau + hp) \, dh
\]

(2)

Fourier transform transforms both sides of the two equations, gets the follow equations in frequency domain as follows:

\[
    U(h, \omega) = \int_{-\infty}^{\infty} V(p, \omega) e^{i\omega ph} \, dp
\]

(3)

\[
    \tilde{V}(p, \omega) = \int_{-\infty}^{\infty} U(h, \omega) e^{i\omega ph} \, dh
\]

(4)

Substituting Eq.(3) into Eq.(4), we obtain Eq.(5) as follows:

\[
    \tilde{V}(p, \omega) = \int_{-\infty}^{\infty} V(p', \omega)(\int_{-\infty}^{\infty} e^{i\omega h(p-p')} \, dh) \, dp'
\]

(5)

Convolution operator is as follows:

\[
    \gamma(p, \omega) = \int_{-\infty}^{\infty} \frac{1}{|\omega|} e^{iph} \, dh = \frac{2\pi}{|\omega|} \delta(p)
\]

(6)

Convolution operator is an impulse function about \( p \), we obtain Eq.(7) as follows because of the convolution property.

\[
    \tilde{V}(p, \omega) = \frac{2\pi}{|\omega|} V(p, \omega) * \delta(p) = \frac{2\pi}{|\omega|} V(p, \omega)
\]

(7)

Inverse transform formula of the raw data is as follows:

\[
    V(p, \omega) = \frac{|\omega|}{2\pi} \tilde{V}(p, \omega) = \frac{|\omega|}{2\pi} \int_{-\infty}^{\infty} V(p, \omega) e^{i\omega ph} \, dh
\]

(8)
h ∈ [−H, H], we obtain Eq.(9) and Eq.(10) as follows:
\[ γ(p, ω) = \int_{-H}^{H} e^{iωhp} dh = 2H \frac{\sin(ωhp)}{ωhp} \] (9)
\[ \tilde{V}(p, ω) = V(p, ω) * γ(p, ω) = 2H \int_{-∞}^{∞} V(p', ω) \frac{\sin(ωH(p-p'))}{ωH(p-p')} dp' \] (10)

This kind of definition defines inverse transform at first, then induces the transform by the least-square inversion[6].

Discrete Linear Radon transform

The definition of discrete linear Radon transform is as follows. \( d(x, t) \) is the data in t-x domain, \( m(p, τ) \) is the data in \( τ-p \) domain, \( p \) is slope, \( τ \) is time intercept.
\[ m(p, τ) = \sum d(h, t = τ + ph) \] (11)

Fourier transform transforms both sides of the two equations, gets the follow equations in frequency domain as follows:
\[ M(ω, ω) = \sum d(h, ω) e^{iωph} \] (12)
Eq.(12) is written in matrix form as follows:
\[ M = LD \] (13)

The definition of inverse transform is as follows:
\[ D = L^H M \] (14)

H is conjugate transpose operator, the transform is as follows by the least-square inversion.
\[ M = (L^H + μI)^{-1} LD \] (15)

In order to stable the inversion process, we usually introduce damping factor. The value of M usually between 0.1 and 1.
\[ M = (L^H + μI)^{-1} LD \] (16)

Nonlinear Radon transform

The algorithm of nonlinear Radon transform is similar to linear Radon transform. Linear Radon transform superposes data according to the slanted line \( t = τ + hp, τ \) is time intercept ,p is slope. Nonlinear Radon transform superposes data according to the parabola \( t = τ + h^2q, q \) is curvature parameters[7]. Thus, we can deduce nonlinear Radon transform by the same method.

Radon transform flow chart

Radon transform is used wildly in wave separation, transforms data from an old filed into a new filed, and separates each component in the new filed, reserves the useful section.

Algorithm achievement

The program is compiled by MATLAB, which is divided into five menu bar: data input, format conversion, linear Radon transform, nonlinear Radon transform, as well as help.

Transfoms data from an old filed into a new filed, and separates each component in the new filed, reserves the useful section. In order to testify fidelity of Radon transform, this article uses experimental data.

There are two pulses in Figure 2a. In Figure 2b, the data is transformed from t-x domain to Radon domain. We can conclude that this program is stable, on the other hand, linear Radon transform has smearing effect.
There are two pulses in Fig. 3a. In Fig. 3b, the data is transformed from t-x domain to Radon domain. Nonlinear Radon transform suppresses the smearing effect, improves the accuracy.
Figure 3. Nonlinear Radon transform result

Conclusion

This article studies linear and nonlinear Radon transform, and compiles the program based on MATLAB. We conclude that nonlinear Radon transform suppresses the smearing effect. Thus, Radon transform is a more effective method in wave separation.
