\textbf{Abstract.} An efficient one-pot protocol for the synthesis of symmetrical diinosine triphosphate (Ip\textsubscript{3}I) and diinosine tetraphosphate (Ip\textsubscript{4}I) from inosine 5′-phosphoropiperidate has been developed. The experimental results indicated that the employment of DCI activation could notably promote the reaction rate and yield.

\textbf{Introduction}

Inosine is the key nucleoside component and participates in the cellular functions and energy metabolism [1]. It has been reported that inosine exhibits radioprotective effect in animal models [2,3]. Moreover, inosine also has been proved to have immunomodulatory and neuroprotective effects [4,5]. Furthermore, the polyphosphates of inosine analogs with pharmaceutical activities have been of importance to the investigation of anticancer and antiviral drugs [6,7].

Compared to nucleoside triphosphates and tetraphosphates, symmetrical dinucleoside triphosphates and tetraphosphates are of better chemical and metabolism stability [8–10]. As a kind of potential pharmaceutical agents, symmetrical diinosine polyphosphates have been widely investigated in many other frontier fields including molecular biology, biochemistry, medicinal chemistry [11,12]. For instance, diinosine polyphosphates, such as Ip\textsubscript{3}I and Ip\textsubscript{4}I, have effects in the modulation of the intraocular pressure in normotensive New Zealand white rabbits.

So far, there are a few synthetic methods available for the preparation of dinucleoside triphosphates and tetraphosphates. The most widely used method is the condensation of nucleoside monophosphates and nucleoside diphosphates/triphosphates with different activated reagents [13–15]. However, these methods are typically low yielding, and the products are difficult to isolate in high purity. More recently, we developed an efficient method for the synthesis of dinucleoside polyphosphates from the nucleoside phosphoropiperidate precursors [16]. In this paper, we report a one-pot and practical method for the synthesis of diinosine polyphosphates (Ip\textsubscript{3}I and Ip\textsubscript{4}I) without using inosine polyphosphates.

\textbf{Experimental}

Chemical reagents and solvents were obtained from commercial suppliers. Inosine 5′-phosphoropiperidate was prepared according to known procedures [16]. All reactions were performed under an atmosphere of dry argon. Ion exchange chromatography employed DEAE A-25 exchanger. IR spectra were recorded on a FT-IR spectrometer. All NMR spectra were obtained with a 400 MHz instrument with chemical shifts reported in parts per million (ppm, $\delta$) and referenced to D$_2$O. Low-resolution mass spectra were obtained with an ion trap mass spectrometer and
reported as m/z.

$P^1$, $P^3$-Diinosine-5',5'-triphosphate, Trisodium Salt (2)

To a solution of inosine 5'-phosphoropiperidate (41 mg, 0.1 mmol) in N-methylpyrrolidone (1.5 mL) were added bis (tetra-n-butylammonium) monophosphate (4 mg, 0.04 mmol) and DCI (35 mg, 0.3 mmol). The reaction was stirred at 20 °C for 24 h and concentrated in vacuo. The residuum was dissolved in NaOAc aqueous solution (3 M, 0.5 mL) and EtOH (30 mL) was added. The resulting white precipitate was collected by centrifuge. The crude product was dissolved in deionized H2O (1 mL) and loaded on a DEAE Sephadex A-25 ion exchange column (1.6 × 25 cm). Elution with NH4HCO3 buffer (linear gradient 0.3 to 0.6 M), combination of appropriate fractions, and lyophilization afforded Ip3I in ammonium salt form. Passage of the solution of the ammonium salt in deionized H2O through a bed of Dowex 50W-X8 ion exchange resin (Na+ form) and lyophilization afforded Ip3I as trisodium salt, white solid (2, 47 mg, 57%); 1H NMR (D2O, 400 MHz): $\delta$ 8.12 (s, 2H), 7.97 (s, 2H), 5.84 (d, $J$ = 5.2 Hz, 2H), 4.63 (dd, $J_1$ = $J_2$ = 5.2 Hz, 2H), 4.50 (dd, $J_1$ = $J_2$ = 4.4 Hz, 2H), 4.30–4.26 (m, 6H) ppm; 13C NMR (D2O, 100 MHz): $\delta$ 159.3, 154.3, 151.1, 136.9, 115.9, 87.1, 83.1, 73.9, 69.7, 64.7 ppm; 31P NMR (D2O, 162 MHz): $\delta$ 11.5 (d, $J$ = 19 Hz, 2P), −23.2 (t, $J$ = 19 Hz, 1P) ppm; IR (KBr): $\nu$max 3673, 3450, 2952, 2748, 2654, 2490, 2349, 1699, 1478, 1401, 1243, 1117, 1052, 850, 795, 723, 643, 511 cm⁻¹; LRMS (ESI−): m/z calcd for C20H24N8O18P3 [M−H]− 757.0; found 757.1.

$P^1$, $P^4$-Diinosine-5',5'-tetraphosphate, Tetrasodium Salt (3)

To a solution of inosine 5'-phosphoropiperidate (41 mg, 0.1 mmol) in N-methylpyrrolidone (1.5 mL) were added tris(tetra-n-butylammonium) hydrogen pyrophosphate (7 mg, 0.04 mmol) and DCI (35 mg, 0.3 mmol). The residue was dissolved in NaOAc aqueous solution (3 M, 0.5 mL) and EtOH (30 mL) was added. The resulting white precipitate was collected by centrifuge. The crude product was dissolved in deionized H2O (1 mL) and loaded on a DEAE Sephadex A-25 ion exchange column (1.6 × 25 cm). Elution with NH4HCO3 buffer (linear gradient 0.3 to 0.6 M), combination of appropriate fractions, and lyophilization afforded Ip3I in ammonium salt form. For characterization, passage of the solution of the ammonium salt in deionized H2O through a bed of Dowex 50W-X8 ion exchange resin (Na+ form) and lyophilization afforded Ip3I as tetrasodium salt, white solid (3, 32 mg, 34%); 1H NMR (D2O, 400 MHz): $\delta$ 8.13 (s, 2H), 7.98 (s, 2H), 5.83 (d, $J$ = 5.2 Hz, 2H), 4.62 (dd, $J_1$ = $J_2$ = 5.2 Hz, 2H), 4.51 (dd, $J_1$ = $J_2$ = 4.4 Hz, 2H), 4.32–4.28 (m, 6H) ppm; 13C NMR (D2O, 100 MHz): $\delta$ 159.2, 154.6, 151.4, 136.7, 115.9, 87.2, 83.3, 73.7, 69.6, 64.7 ppm; 31P NMR (D2O, 162 MHz): $\delta$ −11.6 (d, $J$ = 19 Hz, 2P), −23.4 (t, $J$ = 19 Hz, 1P) ppm; IR (KBr): $\nu$max 3672, 3451, 2953, 2748, 2653, 2490, 2349, 1699, 1478, 1401, 1243, 1117, 1052, 857, 795, 721, 643, 510 cm⁻¹; LRMS (ESI−): m/z calcd for C20H25N8O18P4 [M−H]− 837.0; found 837.1.

Results and Discussion

As shown in Scheme 1, symmetric diinosine triphosphate (2) was synthesized by treating inosine 5'-phosphoropiperidate (1) with 0.4 equiv of bis (tetra-n-butylammonium) monophosphate and 3.0 equiv of DCI at 20 °C in N-methylpyrrolidone for 24 h. Ethanol precipitation followed by ion exchange chromatography afforded Ip3I in 57% yield. The effect of reaction temperature was...
also tested for the formation of Ip₃I (Table 1). The reaction time could be significantly shortened with increasing temperature. The ⁳¹P NMR spectra of the crude reaction mixture showed that the amount of nucleoside monophosphate and polyphosphate byproducts began to increase when the reaction temperature was elevated above 20 °C.

\(^a\)⁳¹P NMR yield

Similar to the synthesis of Ip₃I (2), treatment of inosine 5′-phosphoropiperidate (1) with 0.4 equiv of bis(tetra- n-butylammonium) hydrogen pyrophosphate and 3.0 equiv of DCI at 20 °C in N-methylpyrrolidone for 24 h followed by ion exchange chromatography afforded Ip₄I in 34% yield.

**Summary**

In summary, a facile one-pot method has been developed for the synthesis of Ip₃I and Ip₄I. The synthesis of symmetrical dinucleoside polyphosphates based on nucleoside phosphoropiperidate/DCI system avoided the use of poorly soluble and expensive inosine polyphosphates reagents, and significantly simplified the synthesis of Ip₃I and Ip₄I.
