Keywords: Hilbert Type inequality; Cauchy inequality; monotonicity of functions

Abstract. In this paper, by using Cauchy inequality, monotonicity of functions, Hilbert type inequality with finite series version is established.

Introduction

If \( a_n \geq 0, b_n \geq 0 \), such that \( 0 < \sum_{n=1}^{\infty} a_n^2 < \infty \), \( 0 < \sum_{n=1}^{\infty} b_n^2 < \infty \), then the well known Hilbert inequalities are given by

\[
\sum_{n=1}^{\infty} \sum_{m=1}^{\infty} \frac{a_m b_n}{m+n} < \left( \sum_{n=1}^{\infty} a_n^2 \right)^{1/2} \left( \sum_{n=1}^{\infty} b_n^2 \right)^{1/2}.
\]

(1)

Hilbert type inequalities are given by

\[
\sum_{n=1}^{N} \sum_{m=1}^{N} \frac{a_m b_n}{\max(m,n)} < \left( \sum_{n=1}^{N} a_n^2 \right)^{1/2} \left( \sum_{n=1}^{N} b_n^2 \right)^{1/2}.
\]

(2)

(see Hardy et al.[1]). In recently years, various improvements and extensions of the Hilbert inequality and Hilbert type inequalities appear in a great deal of papers (see [2-8]). Zhang xiaoming, Chu yuming ([2]) gave improvement of (2) as:

\[
\pi^2 \sum_{n=1}^{N} a_n^2 \sum_{n=1}^{N} b_n^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{a_m b_n}{m+n} \right)^2 \geq \min \{ na_n^2 \} \min \{ nb_n^2 \} \left[ \pi^2 \left( \sum_{n=1}^{N} \frac{1}{n} \right)^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{1}{\sqrt{mn(m+n)}} \right)^2 \right]
\]

(5)

The major objective of this paper is to formulate new inequalities, which is improvement of (5).

Some lemmas

In order to prove our main result we need some lemmas, which we present in this section.

Lemma 1 If \( 1 \leq n \leq N, n, N \) are positive integers, then

(i)
\[
\sum_{m=1}^{N} \frac{1}{\sqrt{m \cdot \max(m,n)}} < 4n^{-\frac{1}{2}}.
\] (6)

\[
\sum_{m=1}^{N+1} \frac{1}{\sqrt{m \cdot \max(m,N+1)}} < 2(N+1)^{-\frac{1}{2}}.
\] (7)

\[
\sum_{m=1}^{N} \sum_{n=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m,n)}} < 4 \sum_{n=1}^{N} \frac{1}{n}.
\] (8)

**Proof. (i)**

Since \( \frac{1}{\sqrt{x \cdot \max(x,n)}} \) is monotone decreasing in the interval \( 0 < x < \infty \), then

\[
\sum_{m=1}^{N} \frac{1}{\sqrt{m \cdot \max(m,n)}} < \int_{0}^{N} \frac{1}{\sqrt{x \cdot \max(x,n)}} \, dx = \int_{0}^{n} \frac{1}{n\sqrt{x}} \, dx + \int_{n}^{N} \frac{1}{x\sqrt{x}} \, dx = 4n^{-\frac{1}{2}} - 2N^{-\frac{1}{2}} < 4n^{-\frac{1}{2}}
\] (ii)

\[
\sum_{m=1}^{N+1} \frac{1}{\sqrt{m \cdot \max(m,N+1)}} < \int_{0}^{N+1} \frac{1}{\sqrt{x \cdot \max(x,N+1)}} \, dx = \int_{0}^{n} \frac{1}{(N+1)\sqrt{x}} \, dx = 2(N+1)^{-\frac{1}{2}}
\] (iii)

\[
\sum_{m=1}^{N} \sum_{n=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m,n)}} < \sum_{n=1}^{N} 4n^{-\frac{1}{2}} = 4 \sum_{n=1}^{N} \frac{1}{n}.
\]

**Lemma 2** Let \( f(N) = 16 \left( \sum_{n=1}^{N} \frac{1}{n} \right)^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m,n)}} \right)^2 \),

then \( f(N+1) > f(N) \).

**Proof.** \( f(N+1) - f(N) \)

\[
= \frac{16}{N+1} \left( 2 \sum_{n=1}^{N} \frac{1}{n} + \frac{1}{N+1} \right) - \left( \frac{2}{\sqrt{N+1}} \sum_{n=1}^{N} \frac{1}{\sqrt{n \cdot \max(N+1,n)}} - \frac{1}{(N+1)^2} \right) \times \left[ 2 \sum_{m=1}^{N} \sum_{n=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m,n)}} \right]
\]

\[
= \frac{16}{N+1} \left( 2 \sum_{n=1}^{N} \frac{1}{n} + \frac{1}{N+1} \right) - \left( \frac{2}{\sqrt{N+1}} \sum_{n=1}^{N} \frac{1}{\sqrt{n \cdot \max(N+1,n)}} \right) \times \left[ 2 \sum_{m=1}^{N} \sum_{n=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m,n)}} + \frac{2}{\sqrt{N+1}} \sum_{n=1}^{N} \frac{1}{\sqrt{n \cdot \max(N+1,n)}} \right]
\]

\[777\]
Main results

**Theorem 1** If $a_n \geq 0, b_n \geq 0, n = 1, 2, L, N$. $N$ is a positive integer, then

$$16 \sum_{n=1}^{N} a_n^2 \sum_{n=1}^{N} b_n^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} a_n b_m \right)^2 \geq \min \left\{ \{n a_n^2\} \right\} \min \left\{ \{nb_n^2\} \right\} \left[ 16 \left( \sum_{n=1}^{N} \frac{1}{n} \right)^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m, n)}} \right)^2 \right]$$

(9)

Proof. Let $c_n = \sqrt{na_n}, d_n = \sqrt{nb_n}$, then inequality (9) is translated into

$$16 \sum_{n=1}^{N} c_n^2 \sum_{n=1}^{N} d_n^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{c_m d_n}{\sqrt{mn \cdot \max(m, n)}} \right)^2 \geq \min \left\{ \{c_n^2\} \right\} \min \left\{ \{d_n^2\} \right\} \left[ 16 \left( \sum_{n=1}^{N} \frac{1}{n} \right)^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m, n)}} \right)^2 \right].$$

(10)

By using Cauchy inequality, we have

$$16 \sum_{n=1}^{N} c_n^2 \sum_{n=1}^{N} d_n^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{c_m d_n}{\sqrt{mn \cdot \max(m, n)}} \right)^2 \geq 16 \sum_{n=1}^{N} c_n^2 \sum_{n=1}^{N} d_n^2 - \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{c_m d_n}{\sqrt{mn \cdot \max(m, n)}} \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{d_n}{\sqrt{mn \cdot \max(m, n)}}.$$ (11)

Let $f(c_1, c_2, L, c_n, d_1, d_2, L, d_n)$

$$= 16 \sum_{n=1}^{N} c_n^2 \sum_{n=1}^{N} d_n^2 - \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{c_m d_n}{\sqrt{mn \cdot \max(m, n)}} \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{d_n}{\sqrt{mn \cdot \max(m, n)}}.$$ to compute the partial derivatives of a function $f(c_1, c_2, L, c_n, d_1, d_2, L, d_n)$ with respect to $c_i, d_i$, and using lemma 1, we have

$$\frac{\partial f}{\partial c_i} = \frac{32c_i}{i} \sum_{n=1}^{N} d_n^2 - \sum_{n=1}^{N} c_n \frac{2c_i}{i} \sum_{n=1}^{N} d_n^2 \left( \sum_{m=1}^{N} \frac{1}{\sqrt{mn \cdot \max(m, n)}} \right)$$

$$> \frac{32c_i}{i} \sum_{n=1}^{N} d_n^2 - \frac{2c_i}{i} \cdot 4i^{-\frac{N}{2}} \sum_{n=1}^{N} d_n^2 \sqrt{n} \sum_{n=1}^{N} \sqrt{n} = 0.$$ 

thus $f(c_1, c_2, L, c_n, d_1, d_2, L, d_n)$ is monotone increasing for $c_i$. In a similar way we can prove that $\frac{\partial f}{\partial d_i} > 0$, and this implies $f(c_1, c_2, L, c_n, d_1, d_2, L, d_n)$ is monotone increasing for $d_i$. We obtain

$$f(c_1, c_2, L, c_n, d_1, d_2, L, d_n) \geq f \left( \min \left\{ c_n \right\}, \min \left\{ c_n \right\}, L, \min \left\{ c_n \right\}, \min \left\{ d_n \right\}, \min \left\{ d_n \right\}, L, \min \left\{ d_n \right\} \right).$$

In view of (11), (10) holds. The theorem is proved.
From theorem 1 and lammes 2, we have

**Theorem 2** If \( a_n \geq 0, b_n \geq 0, n = 1, 2, \ldots, N \). \( N \) is positive integer, then

\[
16 \sum_{n=1}^{N} a_n^2 \sum_{n=1}^{N} b_n^2 - \left( \sum_{n=1}^{N} \sum_{m=1}^{N} \frac{a_m b_n}{\max(m, n)} \right)^2 \geq 15 \min_{1 \leq n \leq N} \left\{ na_n^2 \right\} \min_{1 \leq n \leq N} \left\{ nb_n^2 \right\}. \tag{12}
\]
