Keywords: Medical examination, rationality, criteria.

Abstract. The connotation of medical check rationality is quite complicated, and its evaluation standards must be multidimensional and multifaceted. Whether the cognizance of the medical examination is reasonable or not is not the proliferation of personal subjective random and emotions. From a certain extent, the rationality of the medical examination evaluation standards of materiality is to balance the interests of the subject of medical examination related a strategy or structure, not only embodies the government of our country health enterprise nature and the development goal of positioning, both doctors and embodies the main body to compete for power in the struggle for their own interests, but also implies the social economic benefit allocation mechanism and the concept of health interests of different social groups.

Introduction

Medical examination technology is one of the medical technology, medical science and other areas of science and technology and the combination of the product of applied to medical practice. Medical examination by medical inspection equipment operation technology and medical examination behavior of medical information processing technology of two parts. The former is referred to as the object of medical examination technology elements, and can be referred to as the medical check material technology. The latter called medical examination technology main body elements, and can be referred to as the medical check technical ability. Medical examination of these two kinds of technology are not isolated, but rather complementary, technician have medical knowledge, experience, skill and skill is reflected through the materials such as medical equipment technical conditions, by the same token, medical check material technology need through the operation of the medical personnel and medical information processing skills can play their role, the same material will technical conditions for the medical staff of technical ability of different clinical value has very big difference. Technical rationality of medical examination evaluation should, therefore, to distinguish the material technology is reasonable and the technical ability reasonable two levels, according to two different levels corresponding technical features and technical specification requirements, respectively, with specific and comprehensive judgment of argument, and in this way can the rationality of the evaluation is objective and correct.

Text

Countries in order to better protect and promote health of residents, made a number of mandatory and normative health technology assessment and access regulations and policies. Admittance of medical examination technology refers to the relevant experts through safety and effectiveness of medical examination technology, economy and social adaptability of the ethical aspects after evaluating system, in accord with certain standard rear allow applied in patients with diagnosis and treatment of medical institutions service procedures and provisions. Medical examination technology clinical access should follow the scientific, safe, standardized, effective, economic and ethical principles. By the medical institution for the safety, efficacy precise medical examination technique for clinical application of conventional management, by the administrative departments of public health safety,
efficacy precise but involves certain ethical problems or risk control management of higher medical examination technology, involving major ethical issues, high risk and require the use of scarce resources, safety and effectiveness is still subject to standardize clinical trials to further verify the medical examination technology needs to be strict control on the administrative departments for public health. Article 12 of these measures also emphasized the medical institutions to carry out clinical inspection items must be released by the ministry of health grant to carry out clinical inspection items [1]. In general, the admittance of medical examination technology including exploratory admittance of medical examination technology, restricted medical inspection technology application access, the promotion of medical examination technology application access three, each type of access standards and requirements are different, the former yan in the latter, and with the development of medical technology matures and, the existing technical access standards for medical examination should be timely adjust.

To determine the evaluation standards of rationality of technology, the medical examination should adhere to the following basic principles: should distinguish between the medical inspection technology of different types and corresponding access requirements, for different medical examination technology projects should not only have a common evaluation principles, but also reflects the differences in evaluation of technical indicators, to explore medical inspection technology and restrictive medical inspection shall request a higher evaluation. Medical examination evaluation standards of technical rationality should be due to the different historical periods and different parts of the different and have different social and economic development level. Medical examination technology rationality evaluation standards should not only is helpful to promote the development of medical science and medical technology progress and improve the quality of medical treatment, and is beneficial to patients' medical security, technical security of medical examination is the first factor of evaluation of this technology is reasonable, is the first line of defense to protect patients' rights. Medical check the rationality of the evaluation criteria included not only the security of medical examination technology,

Should also include the effectiveness of clinical effect, economy and social ethics, adaptability, etc., among them, the validity refers to the medical inspection efficiency, effectiveness and sensitivity of; Economy refers to the cost-effectiveness and cost-benefit, the rationality of the cost-effectiveness analysis. Social adaptability refers to a specific time and space under the medical examination of social, legal, ethical, and political conditions of anastomosis with the tacit understanding.

In addition, the medical check the rationality evaluation to avoid the impact of medical technology, a medical examination of technology is the medical check service as a purely technical activities, played down the humanity quality and medical ethics accomplishment of medical examination behavior, played down the patient's personality and human nature, and ignore the emotional communication between doctor and patient, ignored the value concept of patients is the medical service center, thus the one-sided pursuit of sophistication and automation, medical technology, the pursuit of medical inspection technology of profit maximization, makes original noble purpose of medical examination provincial and mechanization, at the same time also can cause medical technology limited resources of the waste and waste.

Some scholars think that: "in the west, the legitimacy of the indicates that something has been acknowledged and recognized and accepted, understandable that people from the heart for the political order, authority and power, the country, the government and social groups such as trust, support and approval; in China, most scholars believe that the legitimacy refers to a particular object is the current national legal norms, whoever meets the constitution and the rules of law, is legitimate, is legal." [2] Some scholars also put forward, legitimacy refers to the act of people pursue and realize their own interests conform to the requirements of the current law values and norms.

In recent years, the legal issues have gradually become a hot issue of China's academic circles, more and more scholars begin to target to the legitimacy study of many specific problems [3]. Law is the product of human highly rational, use legal rules to regulate people's behavior is the inevitable requirement of society ruled by law, and also the embodiment of social progress. Because the law with the procedural law and substantive law, public law and private law different categories, such as
legitimacy has procedure legitimacy and the legality of the essence, form validity and legitimacy of
different level, such as the difference between the entity and, therefore, in terms of legitimacy itself,
is indeed a connotation is very rich and controversial concept.

From the law perspective, medical examination behavior is a kind of special legal act, is medical
designed act. Medical practice is divided into special medical legal behavior and general medical legal act,
think the special medical legal act refers to every treatment, correction or to prevent human disease,
injury disability or health care for direct purpose of the examination, diagnosis, and treatment or based on the results of examination, diagnosis, treatment or for the purpose of the prescription drug
behavior such as one or all of the floorboard of:Purpose and generalized medical legal behavior
including diagnosis and treatment of medical legal act, has no therapeutic medical legal behavior,
experimental medical legal behavior and aggressive medical legal act [4]. The scholar thinks, medical
behavior of medical law behavior also can be divided into legal and illegal medical practice, those
allowed by current law, accept or give positive behavior is the legal medical behavior, or for illegal
behavior law. Both doctors at the same time, according to the medical behavior in the process of
implementing whether there is a mutual intention, legal medical behavior can be divided into legal
behavior and medical fact that behavior. And scholars believe that, regardless of the medical behavior
itself is legal or not, if have a positive effect of law, and what legal effect, does not affect the
establishment of the medical behavior, this is just a national law to evaluation results.

Guidance is in the rule of law society, law, constraints, and the evaluation of medical behavior
important specification. According to China's relevant laws, regulations, and department of health
rules and regulations, legal medical examination behavior should include the implementation of
medical examination of the qualification of legal medical institutions, practitioners of subject
qualification, legal, medical examination project and technical process of legal, medical examination
behavior is not in violation of the law, social public interests, etc [5]. With the rule of law in our
country policy of gradually implement, medical checks the have to accept perfect this specification
and regulating medical behavior, medical check the rationality of the evaluation also can not get away
from the legitimacy of natural survey and inspection. A certain extent, the only legitimate medical
examination technology and medical examination behavior might be reasonable, the rationality and
legitimacy of the medical examination are the two interrelated, mutual penetration and mutual
evaluation perspective of regulation.Such as defensive or excessive medical behavior, medical
personnel to use forced urgent mentality health maintenance or repair, or lack of patients using
medical information and their own professional and technical authority, inducing or misleading use
many of the patients with no necessary or reference value for clinical diagnosis and treatment of
medical examination, the medical examination is clearly unreasonable, at the same time, due to the
defensive or excessive medical behavior to bring economic benefits to patients and belongs to the
civil law of civil fraud, cause the patient's physical and mental health hazards also belong to
intentionally hurt others the civil or criminal infringement of the body, or excessive defensive
medical behavior clearly violates the provisions of general legal obligations related law in our
country, is illegal, nature is not reasonable.

From a legal perspective of the rationality of the medical tests, one is to pay attention to both
pursue the results of medical examination behavior motivation and purpose is good, attaches great
importance to the medical examination is the behavior of the process and means proper. Three is both
leave sufficient legal space for medical examination technology development, and to respect the basic
rule of medical research and technological development, abide by the rules and regulations of the
state adjust medical examination behavior.

Medical ethics is a special kind of professional ethics, is the embodiment of the social general
ethics in the field of medicine, through specific medical ethics and code of ethics to influence and
restriction of medical staff, adjustment between doctor and patient, between medical staff and the
relationship between medical staff and society. Medical check the rationality of the evaluation must
penetrate and holds many medical ethics and the basic requirements of the code of conduct, its
rationality and ethical morality has a strong accommodation and complementarity, as you can
imagine, is not in conformity with the ethics of medical examination may not be for reasonable
Medical ethics for medical behavior should be respect, do not harm, benefit and justice four fundamental ethical principles [6]. In medical examination practice, we need to respect patients' personal dignity, privacy and the right of informed consent, understand the patient's medical examination requirements will, it is fair to treat every patient, should earnestly put the patient's physical and mental health benefits and economic benefits as medical examination work the first goal and the primary indicators of quality evaluation.

Work discipline, serious and responsible to each patient or samples to equality, to guarantee the specification of the medical check process and check the result accuracy; third, medical institutions in the introduction and development of new medical check the project, the patients' medical check consumption desire and ability to cope with an in-depth investigation and research, from the perspective of ethics to science and medical technology assessment. At the same time, must strengthen the medical check quality consciousness, strengthening the professional ethics education of medical staff, set up the mechanism of doctor-patient communication, correctly guide the patient's medical examination requirements, the rationality of idea and ethics standard properly combined and implementation of each link to medical examination.

Summary

Medical check rationality evaluation standards should not only consider the medical staff to implement medical examination behavior of professional ethics and professional skills of effective regulation, and the patient's health and other lawful interests of adequate protection, also want to consider the operation rules of the health care industry as well as correlation with the interests of the other industries such as medium, but also by China's political, economic and cultural development and other macroeconomic indicators.
