Abstract - This study was aimed to: (1) describe the students’ and teachers’ needs on Indonesian language learning textbook insight with character education, (2) describe the development of Indonesian language learning textbook model, (3) test the effectiveness of the textbook, and (4) to describe the result of textbook dissemination. The type of the research used was research and development proposed by Borg and Gall. This research was done through 4 stages, namely: (1) exploration, (2) model development, (3) model testing, and (4) dissemination. A qualitative descriptive approach was used in the exploratory stage. In this stage, data was collected through document study, observation, interview, and questionnaire in which then analyzed using interactive analysis model. Experimental research was used in model testing stage. The results of this research were: (1) exploration stage showed that Indonesian textbooks used in Public Elementary School 15 Surakarta, Public Elementary School 02 Kleco, and Public Elementary School 02 Sumber Surakarta had not been in accordance with the students’ and teachers’ needs, (2) Indonesian textbook was developed through preliminary field testing; and (3) model testing stage was done through experimental research in the main field testing. The value of \( t_{\text{calculated}} \) (0.43) was lower than \( t_{\text{table}} \) (1.64). As a result, \( H_0 \) was accepted and the research was stated significant. In conclusion, Indonesian language learning textbook with character education was effective to improve students’ receptive skills.

Keywords: textbook, Indonesian language, character education, active learning, literature

1. INTRODUCTION

The less successful phenomenon of Indonesian language learning in four most dominant elementary schools' grade 5 in Surakarta was due to the students’ low receptive skill level. This was because of, among other reasons, the limitation of textbook as a reference. The existing or commonly used reference books had not fully supported the success of Indonesian language learning in this case the students’ receptive skills.

According to Mustari (2014), the development of character values is a fundamental effort to improve the quality of character of the nation future generations. The character values that are developed are based on 18 indicators, they are religious, honesty, tolerance, discipline, hard work, independent, creative, democracies, curiosity, spirit of nationality, love of the country, appreciate achievement, friendly, peaceful, reading habit, care of the environment, care of the social condition, responsibility. In order to implement the values of these characters in learning, it could be done through the development of an Indonesian textbook characterized by character education for elementary school students.

Ulum (2014) in his research concluded that important character education was instilled to equip learners independently. According to Asma (2014) the values of the characters included religious values, social norms, rules or laws, academic ethics and human rights principles, grouped into five main values, namely: the values of human behavior to God, to himself, to fellow human beings, to the environment, and to the nationality. Widowo (2012) revealed that the noble values contained in the customs and cultures of our tribes, have been studied and summarized. Based on the study, it has been identified the noble values that are internalized to the nation generation through character education. The values are: religious, honesty, discipline, hard work, creative, independent, friendly, peace loving, caring, and responsibility.

Active learning is activities that help students to test their feelings, values, and behaviors (Silberman, 2006). Silberman describes that in active learning, students do a lot of activities. They use their brains to learn ideas, solve problems, and apply what they have learnt. According to Lorenzen (2001) active learning is a method in educating or inviting students to participate actively in the classroom. Active learning aims to optimize the use of all potential possessed by students, so that all students can achieve satisfactory learning outcomes according to their personal characteristics. Therefore, learning to write theater script needs to be done through active learning.
Cherney (2008) reveals that the application of active learning depends on the level of the program, the material, the type of student, the type of class, as well as the discussion required by the students to improve the understanding of the material. The application of active learning is needed to improve the theater script writing skill. The results of research conducted by Meyers & Jones (1993) concluded that by applying active learning strategies, students can express four language skills: listening, speaking, reading, and writing. Afterwards, they also mentioned that the use of active learning could also improve both receptive and productive skill.

Prince's research (2004) concluded that the selection of active learning strategy in learning is an appropriate consideration to make learning effective. Active learning is an effective teaching technique compared to conventional teaching techniques. The advantages of active learning are: (1) students will learn more material; (2) the student may keep the information longer; and (3) students like learning, faculty, and class conditions more as something new and variative. Active learning allows students to study in the classroom with the help of lecturers or without lecturers, and other students.

Learning resources are not just reference books or textbooks. Sudijana (2003) revealed that learning resources are all resources that can be utilized in the interest of teaching and learning, either directly or indirectly, in whole or in part. Furthermore, he said that learning resources can be divided into two parts, namely (1) learning resources designed or deliberately created and used to shape teaching and learning and (2) learning resources that are not specifically designed but can be used to facilitate learning.

Literature can develop students' insights and knowledge into humanly behavior. Literature reflects real life. Literature exudes all that is good and meaningful in human experience. Through his association with literature, students will gain value for their development, namely (1) language development, (2) cognitive development, (3) personality development, (4) social development (Norton, 1987), (5) physical development, (6) moral development, and (7) conceptual growth in the story (Huck, 1987).

The results of research by Culinan (1989) concluded that listening and reading good stories can help improve vocabulary, sharpen sensitivity to language, and expand language usage in the style of writing. In addition, research on the use of children's literature as a source of learning to read has been done by Kathleen Graham a librarian from the South Australian Education Department. The result was that after six months most children increased their language skills according to their chronological age and earned an equivalent value as four years of reading (Hancock, 1994).

Based on the results of the exploratory stage study, students and teachers need Indonesian textbooks which is focused on Receptive Skills. During this time, Indonesian receptive skills materials were not understood by the teacher and there was no support book. Indonesian textbooks on Receptive skills were expected to support the success of learners in learning Indonesian. The receptive skills of learners can increase if an Indonesian receptive skills textbook with character education is available. A good textbook must meet the following standards: (1) in accordance with the basic competence and standards competence established by BSNP; (2) covers the time span of its use; (3) includes the capital, metropolis, and regional authors; (4) in accordance with the principles of multiculturalism; and (5) easy to be understood (Djanali, 2007).

Textbook contains specific materials used as a teaching and learning guide at school (Richards & Rodgers, 2002). Textbooks are usually used in conjunction with other learning resources such as workbooks, teacher reference books or supporting textbooks (Tomlinson & Masuhara, 2008). In order to fulfill the need of Indonesian receptive skill textbook, this research is urgently needed to be done in Surakarta Elementary School, Central Java.

II. RESEARCH METHODOLOGY

This research was conducted by following the flow of research and development procedures (R and D) developed by Borg and Gall (2007). Furthermore, Borg and Gall argued that research and development is a process used to develop and validate educational products. Seals and Richey (1994) stated that research and development as a systematic review of the design, development and evaluation of programs, processes and learning products that must meet the criteria of validity, practicality, and effectiveness. In line with this, Plomp (1999) added the criteria "can show additional value".

According to Borg and Gall (2007), there are 10 steps of research and development, they are: (1) exploration study, (2) planning, (3) design development, (4) preliminary field test, (5) revision of limited field test results, (6) main field test, (7) revision of main field test result, (8) feasibility test, (9) final revision of feasibility test, (10) dissemination and implementation of final product. The ten steps are summarized into 4 main stages, each of which includes several operational steps. The four steps are; (1) the exploration stage, (2) the model development stage, (3) the model testing stage, and (4) the dissemination and implementation of the model stage (Sukmadinata, 2010; Nurkamto, 2012).

In the exploration stage, it was done an in-depth study on the implementation of Indonesian language learning in Elementary school grade V Surakarta. The purpose of this activity was to analyze the students’ and teachers’ needs of Indonesian textbooks that are considered capable in improving students’ receptive skills optimally. The research approach used was qualitative descriptive approach. Researchers emphasize the observation on the interaction between students and teachers in the
implementation of Indonesian language learning in the study sites. Researchers also conducted in-depth interviews and questionnaires to students and teachers, and also analyzing documents related to research problems.

The data of this study were obtained from various data sources available at the study sites. Types of data sources used were: 5 students and 5 lecturers, theater script learning activities in the classroom, and documents or archives. Data collection techniques used were documentation, observation, in-depth interviews, and questionnaires. Data analysis of this research data was conducted with interactive analysis model (Miles and Huberman 1992; Sutopo, 2002), which was carried out in 2 stages: during data collection and after data collection.

In the development stage of the model, the main objective was the production of textbook models. The prototype development of textbook models was cyclical, which was a combination of research and practice (Borg and Gall, 2007). The steps taken included: preparation of prototype, implementation, evaluation of implementation, and revision in a sustainable manner. The procedure used was the Glanz model theory guide (in Borg and Gall, 2007), which includes: data collection, analysis, data interpretation, reflection, and modification. In addition, the Zuber-Skeritt model was also used (in Cohen, 2000), which includes: careful planning, implementation of plans, observation, assessment, evaluation, critical analysis of implementation results, and subsequent cycle determination.

The development was done by way of testing the textbook prototype in the field through limited trials and extensive trials. A limited trial was conducted in the Public Elementary School 15 Surakarta grade 5. Extensive trials were conducted in the Public Elementary School 02 Kleco grade 5 and Public Elementary School 2 Sumber Surajarta grade 5.

Data collection techniques used were document analysis, participant observation, in-depth interviews, tests and focus group discussions. Data analysis was done in two ways: qualitative and quantitative. The model that had been tested was then consulted with the expert in order that the developed textbook model has substantive truth and quality. Validation was done by Prof. Dr. Herman J. Waluyo, M.Pd. (expert of Indonesian Language Education) lecturer of Sebelas Maret University Surakarta.

The testing phase of the model was aimed to test the effectiveness of the textbook model in improving the students’ ability to write theater script. Model testing was done by conducting experimental research. The type of experimental research used was quasi-experimental research. The experimental research design chosen was the Quasy-Experimental Design Model of Non-equivalent Before-after Design (Wiersma, 1986; Cohen et al. 2000; Sugiyono 2013). The experimental procedures used were the concepts of Gall, Gall, & Borg (2007) and Cohen (2000).

The experimental class was 90 students of Public Elementary School 15 Surakarta grade 5. The control class was 75 students of Public Elementary School 02 Kleco grade 5. This study was looking on the main effect of the textbook model on the students’ receptive ability.

Data collection techniques used were a test on the receptive ability. The analysis of the research data was done through two stages, namely the requirements analysis test stage (normality test, homogeneity test, and balance test) and the data analysis stage to test the effectiveness of the model, ie by the mean difference test (independent t-test). The output of the model testing phase is the Indonesian Education Textbook with character education that has been tested in a process and in a product.

This dissemination phase was done by disseminating the Indonesian Education Textbook with character education that had been developed. The textbook can be implemented on Indonesian lesson especially in Elementary schools in Surakarta. Dissemination was done through national seminars, writing articles in international journals, as well as the publication of the textbook with ISBN.

III. RESULT AND DISCUSSION

Based on the findings at the exploration stage, it could be concluded that there was a problem in Indonesian learning process in the Elementary Schools grade 5. The problems were (1) the absence of Indonesian Education textbook with character education, (2) there was no action to improve the students' receptive ability, (3) the teachers did not understand the receptive ability materials, and (4) teachers had not used innovative learning models yet. In principle, students, teachers, and policy makers agreed that the Indonesian Education textbook with character education needed to be developed immediately. Furthermore, based on the analysis of the students’ and teachers’ need, the following results were obtained (1) Indonesian Education textbook with character education should be prepared to facilitate and guide students to improve the receptive ability, (2) innovative learning procedures (active learning) was necessary to a broader trial, (3) the textbook could help the teachers in understanding receptive skill as learning resources and (4) the need of literature as learning resources that can help improving the students’ receptive skills.

Based on the findings at the exploratory stage, there were six things to be done, they were: (1) developing prototype into textbook model of Indonesian Education with character education, (2) validating prototype development model through expert judgment, (3) validating the model through limited trial, (4) validating the model through broader trials, (5) deciding the final textbook models, and (6) concluding the development result.
**Description of Research Data**

This research data was in a form of the students’ receptive skill score of Elementary Schools in Surakarta which was used as research sample, both for experimental class and control class. In the experimental class there were 90 respondents who come from the students of Public Elementary School 15 Surakarta grade 5. They were treated by using Indonesian Education textbook model with character education. On the contrary, there were 85 respondents from the control class who came from the Public Elementary School 02 Kleco grade 5 who were treated by using the old textbook model.

Referring to the above explanation, the total number of respondents was 165, ie 90 respondents in the experimental class, and 75 other respondents in the control class. In the experimental and control classes, all respondents were given test on the receptive ability before treatment (pre-test) and after treatment (post-test).

Based on the above description, the description of research data was grouped into 4 (four), they were: (1) pre-test score data on the students’ receptive ability in the experimental class; (2) post-test score data on the students’ receptive ability in the experimental class; (3) pre-test score data on the students’ receptive ability in the control class; and (4) post-test score data on the students’ receptive ability in the control class. Each study data group would describe its statistical quantities that include: (1) the calculation of central tendencies, such as: mean, median, mode; (2) the calculation of the spread tendency, such as: variance, and standard deviation; (3) the highest score; (4) the lowest score; (5) range; (6) the result of frequency distribution; and (7) the histogram image of the frequency score.

**a. Pre-test Score Data of the Experimental Class**

Based on the descriptive analysis conducted with Excel 2013 program, the pre-test score of 90 students of Public Elementary School 15 Surakarta grade 5 as the experiment class could be reported: (1) central tendency: mean = 39.22, mode = 35, and median = 37; (2) spread tendency: variance = 51.97, and standard deviation = 7.21; (3) the highest score = 55; and the lowest score = 26; (4) range = 29.

Frequency distribution of pre-test score of students’ receptive skill was obtained through calculation steps as follows:
1) determine the range, ie by reducing the highest score with the lowest score: 55 - 26 = 29
2) determine the number of interval classes. In this study 5 interval classes were used
3) determine the length of the interval class by dividing range by number of interval classes: 29 / 5 = 5.8 which then rounded to 6.
4) choose the lower end of the first interval class. This was done by taking the lowest score. Therefore, the first interval class starts from 26.

Based on the steps of preparing the frequency distribution, the frequency distribution of the pre-test score of the students’ receptive ability could be seen in Table 1.

<table>
<thead>
<tr>
<th>Interval Class</th>
<th>absolute frequency ( (f_{abs}) )</th>
<th>relative frequency ( (f_{rel}) )%</th>
</tr>
</thead>
<tbody>
<tr>
<td>26 – 31</td>

</tbody>
</table>

**b. Post-test Score Data of Experimental Class**

Based on the descriptive analysis conducted with Excel 2013 program, the post-test score of 90 students of Public Elementary School 15 Surakarta grade 5 as the experiment class could be reported: (1) central tendency: mean = 82.50, mode = 82, and median = 82; (2) spread tendency: variance = 36.97, and standard deviation = 6.08; (3) the highest score = 95; and the lowest score = 70; (4) range = 25. As the stages of preparing the frequency distribution of the pre-test scores described above, the same calculation was done to the post-test data. The result was: (1) range = 95 – 70 = 25; (2) number of interval classes were set 5; (3) the interval class length 25 : 5 = 5 however, it was then set to 6 to make sure that all of the data could be inputed in the class interval; and (4) the lower end of the first interval class starts from the smallest data of 70.

Based on the above calculation, the frequency distribution of the post-test score of the students’ receptive ability could be seen in Table 2.

c. Pre-test Score Data of the Control Class

Based on the descriptive analysis conducted with Excel 2013 program, the pre-test score of 75 students of Public Elementary School 02Kleco grade 5 as the control class could be reported: (1) central tendency: mean = 40.15, mode = 38, and median = 39; (2) spread tendency: variance = 51.88, and standard deviation = 7.20; (3) the highest score = 55; and the lowest score = 26; (4) range = 29. The preparation of the frequency distribution of the control class pre-test scores data obtained: (1) range = 55 – 26 = 29; (2) number of interval classes were set 5; (3) the interval class length 29 : 5 = 5.8 which was rounded into 6; and (4) the lower end of the first interval class starts from the smallest data of 26.

Based on the above calculation, the frequency distribution of the pre-test score of the students’ receptive ability could be seen in Table 3.

d. Post-test Score Data of the Control Class

Based on the descriptive analysis conducted with Excel 2013 program, the post-test score of 75 students of Public Elementary School 02Kleco grade 5 as the control class could be reported: (1) central tendency: mean = 62.67, mode = 63, and median = 63; (2) spread tendency: variance = 69.04, and standard deviation = 8.31; (3) the highest score = 78; and the lowest score = 43; (4) range = 35. The preparation of the frequency distribution of the control class post-test scores data obtained: (1) range = 78 – 43 = 35; (2) number of interval classes were set 5; (3) the interval class length 35 : 5 = 7 however, it was then set to 8 to make sure that all of the data could be inputed in the class interval; and (4) the lower end of the first interval class starts from the smallest data of 43.

Based on the above calculation, the frequency distribution of the post-test score of the students’ receptive ability could be seen in Table 4.

2. Requirement Analysis Testing

The inferential data analysis to prove that the research hypothesis was accepted or rejected used independent t-test. This statistical data analysis needs to meet several requirement analysis; they are: (1) normality test, (2) homogeneity test, and (3) balance test. Normality test was done using lilliefors technique, while homogeneity of variance test was done using Bartlett’s analysis, and the balance test was done using independent t-test.

a. Normality Test

As mentioned in the above statements, the data tested by normality in this research were two: (1) pre-test post-test score data of students’ receptive skill in experiment group, and (2) pre-test post-test score data of students’ receptive skill in the control group. Here are the normality test results for both groups of data above.

**Normality test for pre-test post-test deviation score data of experimental class**

Normality test toward pre-test post-test deviation score data in experimental class showed maximum \( L_0 \) of 0.0534. From the list of chritical L for Lilliefors test with \( n = 90 \) and real level \( \alpha = 0.05 \), it is obtained \( L_0 = 0.0934 \). From the above comparison, it could be stated that \( L_0 \) was smaller than \( L_c \), thus it could be stated that the pre-test post-test deviation score data of the experiment class came from population with normal distribution.

**Normality test for pre-test post-test deviation score data of control class**

Normality test toward pre-test post-test deviation score data in control class showed maximum \( L_0 \) of 0.0655. From the list of chritical L for Lilliefors test with \( n = 75 \) and real level \( \alpha = 0.05 \), it is obtained \( L_0 = 0.1023 \). From the above comparison, it could be stated that \( L_0 \) was smaller than \( L_c \), thus it could be stated that the pre-test post-test deviation score data of the experimental class came from population with normal distribution.

b. Homogeneity of Variance Test

This homogeneity of variance test was conducted to test the similarity of variance between pre-test post-test score of students’ receptive skill in experimental group and control group. The statistical technique used for this purpose is by Bartlett's test technique. This test was intended to test the null hypothesis (H_0) which stated that the variance of pre-test post-test score between experimental class and control class was homogeneous on the real level \( \alpha = 0.05 \) against the alternative hypothesis (H_1) which stated that between the variance of pre-test post-test score of the experimental class and the control class was not homogeneous at the same real level. The test criterion used was that \( H_0 \) is rejected if it turns out that \( \chi^2_{\text{obtained}} \) smaller than \( \chi^2_{\text{table}} \).

\[
\chi^2_{\text{obtained}} = \chi^2_{\text{table}}
\]

Homogeneity test between variance of pre-test post-test enumeration score of students' receptive skill in the experimental group and the control group resulted in \( \chi^2_{\text{obtained}} = 11.14 \). From the chi-squared distribution table with df (degrees of freedom) 1 and the real level \( \alpha = 0.05 \) obtained \( \chi^2_{\text{table}} = 3.84 \) which was much larger than \( \chi^2_{\text{obtained}} \). Thus, based on the testing criterion, the null hypothesis \( (H_0) \) which stated that the variance of pre-test post-test score of the students’ receptive ability in the experimental group and the control group was homogenous was accepted. The conclusion was that the variance of pre-test post-test score deviation in the students’ receptive ability in both groups was homogeneous.

c. Balance Test

The balance test aims to test the average equation of students’ receptive skill between the experimental group and the control group. The statistical test used is t-test with the real level \( \alpha = 0.05 \). Hypothesis proposed: \( H_0 \) if \( t_{\text{obtained}} < t_{\text{table}} \) then the students’ variance score of the receptive ability of both groups are not balanced. \( H_1 \) if \( t_{\text{obtained}}> t_{\text{table}} \) then the students’ variance scores of both groups were balanced. The test result showed that \( t_{\text{obtained}} = 1.02 < t_{\text{table}} = 1.67 \). It could be concluded that the average score of the students’ receptive ability of experimental group and the control group was balanced.

3. Hipotesis Test

Hypothesis testing here means to know whether the proposed null hypothesis (H_0) is rejected, or vice versa at certain level of confidence the proposed alternative hypothesis (H_1) is accepted. In accordance with those mentioned in the previous section, the research hypotheses was tested by independent t-test technique. The technique of statistical analysis was used to observe the effectiveness of the treatment in the use of the textbook model, with those who did not use the textbook model. The effectiveness of the textbook model to improve the receptive ability of Elementary School Students grade 5 in Surakarta was tested.
Based on statistical analysis with independent t-test technique, it showed that t-obtained was 0.43. Meanwhile, the critical area: \( t_{0.05; 163} = 1.64 \) so critical area: \( \{ t < -1.64 \text{ or } t > 1.64 \} \). It could be seen that and \( t_{\text{obtained}} = 0.43 < t_{\text{table}} \) so \( H_0 \) was accepted. Thus, there was a significant difference between the receptive ability of students who were taught using the textbook model with students who were taught using the used textbook. In other words, there were significant difference between the students’ receptive skill for those who used Indonesian Education textbook with character education through active learning using literature as a learning resources compared with those who used the government textbook.

The implementation of active learning is very supportive on theater education learning to improve the receptive ability optimally. Cherney (2008) concluded that the application of active learning was based on the level of the program, the material, the type of students, the type of class, and the discussion required by the students to improve the understanding of the material. The application of active learning is needed to improve the understanding of the material in this case is the receptive skill. Meyers & Jones (1993) concluded that by the application of active learning strategies, students could express four language skills, they are listening, speaking, reading, and writing. Katleen Graham research showed that the use of children literature as the learning resources for six months could improve the students’ language competencies as their chronological ages (Hancoock, 1994). Thus, the application of active learning in the Indonesian Language learning by using literature as the learning resources was effective to improve the students’ receptive ability.

IV. CONCLUSION

The exploratory stage showed that Indonesian Education textbook recently used in the Public Elementary School 15 Surakarta, Public Elementary School 02 Kleco, and Public Elementary School 2 Sumber, Surakarta has not meet the students’ and teachers’ need. The model development stage produced Indonesian Education textbook through preliminary field testing. Testing the effectiveness of the textbook model was done through main field testing. The value of \( t_{\text{obtained}} = 0.43 \) meanwhile the critical area: \( t_{0.05; 163} = 1.64 \); thus \( t_{\text{obtained}} < t_{\text{table}} \) thus \( H_0: \mu_1 = \mu_2 \) was accepted. The dissemination stage was done through socializing the textbook in national seminars, international journals, and published the Indonesian Education textbook with character education with ISBN. The Indonesian Education textbook with character education and local wisdom effectively improve the students’ receptive skill. The textbook could be accepted by teachers, policy makers, and students as teaching materials.
