

and substance foundation to professional courses. We form manufacture-teaching committee with enterprise experts and formulate talent training plans together which unify teaching content and post core abilities. Develop teaching content about typical manufacturing process on basis of actual manufacturing process[5-7]. The target of enterprise post training is the target of practicing teaching; the process of enterprise post training is the process of practicing teaching; the form of enterprise post training is the form of practicing teaching. Let the work task integrate into teaching task and bring actual manufacturing task to class. Practice actual problem and connect the teaching and post task.

Power correlated major in Zhengzhou Electric Power College connects with industry development and cooperate with enterprise. In the construction of combination mode, power correlated courses have been resolved and recombination. The courses have changed into courses which are corresponding to post requirements. In the practice teaching, the teachers should combine the content with post requirements and select typical work task which is advanced, operable and practicable. In the construction of teaching material, we should unite the enterprise, invite enterprise experts to participate in teaching material compilation, introduce enterprise technique standard and rules. On base of these, compile a series of professional core teaching material which emphasize operable and practicable according to teaching rules.

3) *The organization and actualization of teaching*

Enterprise training base serves enterprise workers who are trained in one-to-one training environment. In training process, there are different requirements about different job post. The vocational education course should be organized with work task, adopt the combination of work and study, break the team-class-time about teaching form. There are still class, but training carried on personally or in small team instead of whole class together. Courses carried on in the form of work process instead of theory led. Study time adopts flexible arrangement on the basis of the task.

4) *Systemic warrant*

The construction and running of training base is a new mode which combines college with enterprise to achieve win-

win situation. We should consider both the requirement -s in construction, running, management, break the original management, publish new detailed and strict system to make sure running effect and not lack of teaching target. Only this, can we ensure the students' learning and enterprise training.

5. Conclusion

The construction of the new mode is one of the exploration which is under the combination of college and enterprise by Zhengzhou Electric Power College. The exploration is about training and studying. The emphasis of vocational college in improving teaching conditions, highlight teaching feature and enhance teaching quality are strengthening practice teaching condition, completing practice teaching management system, deepening reform of practice teaching. In the reform of Electric Power of HeNan training base construction and college major construction, we sized content development and system innovation. For cultivating high-quality skilled talent to satisfy enterprise, we should make sure meet the requirement of skill training in condition, develop resource advantage in running system, arouse the enthusiasm of teaching and studying. We has explored the reform of practice teaching system and strive to be carried out.
